2D Profile Measuring Sensors

ZG - Smart Profile Sensor

The easy way to get your profile

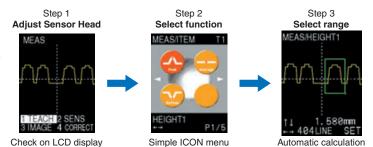

The smart ZG sensor solves ambitious profile measurement applications. An easy and intuitive user interface enables efficient installation, setup and operation. The advanced processing technology is a break-through for the needs of high speed processes. Precise shape measurement is guaranteed on challenging materials and surfaces. A built-in LCD monitor presents the measurement result in real time.

- · Easy to use intuitive user interface
- Live built-in LCD monitor for setup and immediate profile display
- · Versatile 18 measurement tools
- Accurate 5 µm resolution
- · Wide profiles up to 70 mm
- · Fast 5 ms sampling time
- Smart powerful PC software for configuration and post-processing (optional)

Easy to use

Complex operational procedures are time consuming and costly. The new ZG differentiates from standard products by its usability. The intuitive icon based menu, enables an easy setup and configuration of advanced measurement tasks within 3 steps.

Live - built-in LCD monitor

The built-in LCD monitor of the ZG represents an intuitive user interface for easy setup and immediate live feedback of measurement result. This helps to save time for the initial configuration, change of measurement task and reduces the training efforts for personnel. A fine tuning of the settings can be achieved in seconds. The LCD monitor enables to check the measurement result at any time during operation, without the need to connect an external PC. The reaction time for maintenance activities can be short-

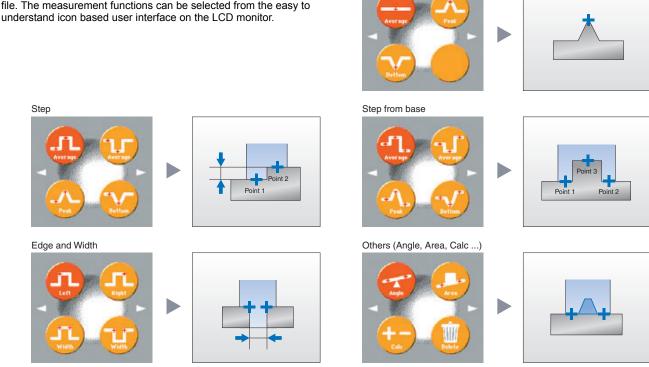

Check results on display

Versatile - diverse measurement functions

The ZG can solve advanced measurement tasks. Up to 18 different functions are available to meet the requirements of the applications. They allow to calculate e.g. the width, height, angle or area of the profile. The measurement functions can be selected from the easy to understand icon based user interface on the LCD monitor.

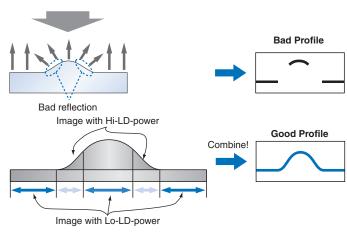

Height

Intelligence inside - automatic adjustment of laser power

In many industrial processes sensors have to deal with difficult or changing materials. In order to avoid time consuming reconfigurations to reliably detect the objects, the sensor by itself has to manage the constraints of the process. The ZG provides an automatic adjustment of the laser power, depending on the surface of the object. The deviation of the reflection, e.g. of different colors can be compensated by increasing or decreasing the laser power to achieve the best result.

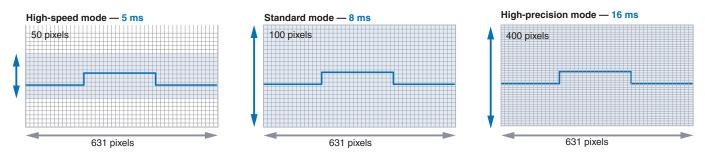

Further improvements of the measurement result can be achieved e.g. on shiny surfaces. The reflection level on different parts of the measurement object can be different, which can result in incomplete profiles.

To complement the profile ZG has the capability to take several images and to combine them. The "multi-sensitivity function" allows to adjust the incident light on the different parts of the object and to retrieve a complete shape.

Flexible - balance between speed and accuracy

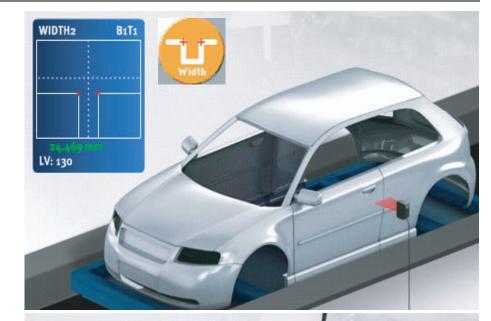

The ZG Smart profile sensor offers different modes of operation, which allows adjusting the sensor behavior to the application requirements. The optimization can be done either towards high speed or high accuracy. For high speed processes the sampling time can be decreased to 5 ms. In the other direction 5 μ m accuracy can be achieved.

Applications

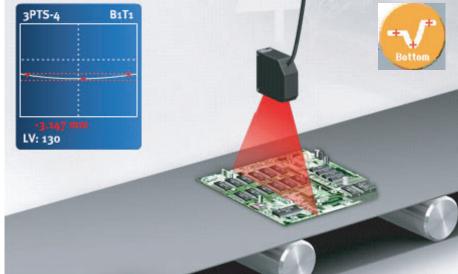

Width measurement - car body

- Task: Measure the gap between different parts of the car body
- · Industry: Automotive
- Challenge: Changing colours of the objects
- Solution: Automatic Laser power adjustment in ZG
- Key point: Higher accuracy than vision systems

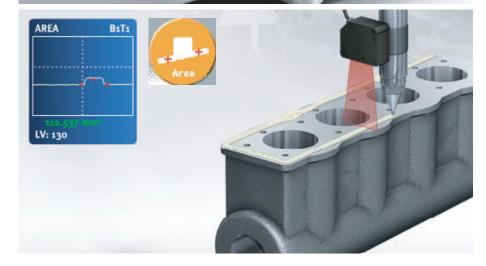

Warpage measurement - PCB

- Task: Measure the warpage of a PCB to avoid soldering or connection defects
- Industry: Electronics

Area measurement - glue bead measurement

- Task: Measure the presence or shape of a glue bead to control the continuous motion of a robot
- Industry: Automotive

Position measurement - paper

- Task: Control the position of the paper and check whether there is a drift (meandering)
- Industry: Paper

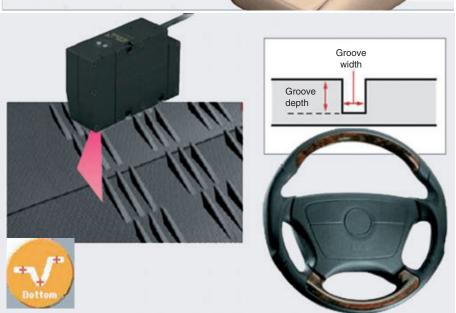

Angle measurement - car seat

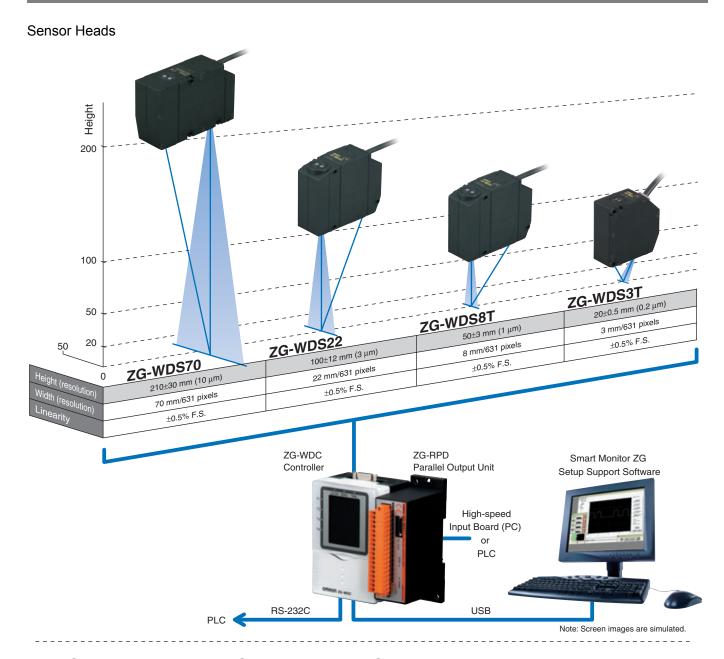

- Task: Measure the angle of the car seat
- Industry: Automotive
- Key point: Controller can calculate any angle by defining additional tasks

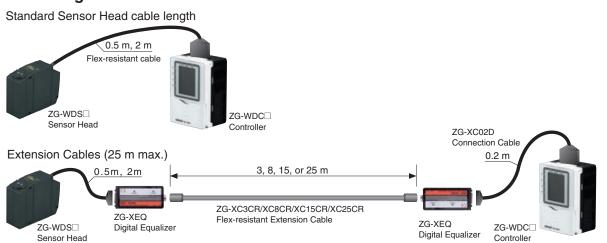

Measuring air-bag notch

- Task: Measure depth and width of an airbag notch
- Industry: Automotive
- Key point: High accuracy

Cable length between Sensor Head and Controller

Note: 1 .Obtained by setting an OMRON standard measurement object at the measurement center distance and determing the average height of the beam line. The conditions are given in the table below. However, satisfactory resolution cannot be attained in strong electromagnetic fields

noide.						
		Aver-	Measurement o	bject		
Model	Mode	age No. of Oper- ations	Regular reflective	Diffuse reflective		
ZG-WDS70/ WDS22/ WDS8T	Stan- dard mode	16	OMRON standard white alumin ceramic object			
ZG-WDS3T	Stan- dard mode	32	OMRON stan- dard mirrored object	OMRON stan- dard diffuse re- flective object		

2 . The tolerance for an ideal straight line obtained by determing the average height of an OMRON standard measurement object for the beam line. The CCD standard models used. Linearity varies depending on the measurement object.

ſ	Model	Measurement object		
	Model	Regular reflective	Diffuse reflective	
	ZG-WDS70/ WDS22/WDS8T	OMRON standard white alumina ceramic		
		OMRON standard mir- rored object	OMRON standard dif- fuse reflective object	

- A value attained by using an aluminium jig to secure the distance between the Head and the measurement object. The CCD standard mode is used.
- Defined as 1/e² (13.5%) of the center light intensity. This may be influenced when light leakage also exists outside the defined area and the reflectivity of the light around the measurement object is higher than that of measurement object.
