# **SIEMENS**

#### Safety guidelines

This manual contains notices which you should observe to ensure your own personal safety, as well as to protect the product and connected equipment. These notices are highlighted in the manual by a warning triangle and are marked as follows according to the level of danger:

#### Danger

indicates that death, severe personal injury or substantial property damage **will** result if proper precautions are not taken.

#### Warning

indicates that death, severe personal injury or substantial property damage **can** result if proper precautions are not taken.

#### Caution

indicates that minor personal injury or property damage can result if proper precautions are not taken.

#### Caution

indicates that property damage can result if proper precautions are not taken.

#### Attention

draws your attention to particularly important information on the product, handling the product, or to a particular part of the documentation.

#### Qualified personnel

Only **qualified personnel** should be allowed to install and work on this equipment. Qualified persons are defined as persons who are authorized to commission, to ground, and to tag circuits, equipment, and systems in acc. with established safety practices and standards.

#### **Correct usage**

Note the following:

#### Warning

This device and its components may only be used for the applications described in the catalogue or the technical descriptions, and only in connection with devices or components from other manufacturers which have been approved or recommended by Siemens.

This product can only function correctly and safely if it is transported, stored, set up, and installed correctly, and operated and maintained as recommended.

#### Brands

SIMATIC®, SIMATIC HMI® and SIMATIC NET® are brands of SIEMENS AG. Some other designations used in these documents are also brands; the owner's rights may be violated if they are used by third parties for their own purposes.

#### Copyright Siemens AG 2001 All rights reserved

The reproduction, transmission or use of this document or its contents is not permitted without express written authority. Offenders will be liable for damages. All rights, including rights created by patent grant or registration of a utility model or design, are reserved.

#### **Disclaimer of liability**

We have checked this manual to ensure that its contents are correct and applicable in relation to the hardware and software it describes. Despite all our endeavors, however, discrepancies cannot be wholly excluded and so we cannot guarantee complete correctness and applicability. However, the data in this manual are reviewed regularly and any necessary corrections included in subsequent editions. Suggestions for improvement are welcomed.

## Introduction

Siemens is one of the leading manufacturers of switchgear. The product range extends from devices that switch a few mA to circuit breakers used in power distribution.

Throughout the continuing development of these products we have always striven to ensure that requirements in terms of fundamental performance features, electrical and mechanical service life, dimensions, and ease of installation and maintenance are met or exceeded.

We have been able to meet the demands resulting from increased environmental awareness, particularly in the last ten years or so, by developing and using environment-friendly and recyclable materials. As a result, we have developed modern industrial switching devices, particularly in the field of low-voltage switchgear, that meet all the relevant demands in terms of environment-friendliness.

Building on decades of experience, we have created a completely new generation of circuit breakers, contactors, auxiliary contactors, overload relays, contactor relays, time relays, and 3RW3 semiconductor motor control devices (referred to below as soft starters) under the name SIRIUS for the large and continuously growing number of motor drives in the range up to 45 kW.

These new SIRIUS devices fulfill all the demands placed on them in practice and can be used as stand-alone devices or modular components of complete load feeders, or integrated in low-voltage distribution cabinets or lowvoltage switching stations.

# 1.1 Specifications/regulations/approvals

Explosion protection	Motor protection devices that protect a motor from overload in a hazardous area must meet certain requirements. These requirements are defined in the following standards: DIN VDE 0660, DIN VDE 0165, EN 60947-1:1991+A11:1994, EN 60947-4-1, EN 50014:1994, EN 50019:1978+A1 to A5 Compliance with these standards has up until now been established by means of a test. Compliance could be documented in two ways: 1. By a test certificate from the manufacturer 2. By a test certificate from an independent test laboratory (e.g. PTB, DMT, KEMA, etc.).
EU directive	Testing of explosion protection has been defined more precisely as a result of the harmonization of the European Union. In addition to the above stan- dards, tests will also carried out in acc. with the EU directive 94/9/EC or ATEX 100a. Two procedures are in operation during the transition period up until 2003:
	<b>Procedure 1</b> Test certificate from an independent test laboratory as usual (e.g. PTB, DMT, KEMA, etc.).
	<b>Procedure 2</b> Special test certificate from certified test laboratories (in acc. with extended European rules). The statutory basis for this is the Official Journal of the European Union (no. 95/C2 15/02 of 19.08.1995).
	Siemens SIRIUS switching devices are tested and certified twice:
Certificate 1	Test certificate from KEMA in the same way as before (valid until 2003) in acc. with: • DIN VDE 0660, DIN VDE 0165 • EN 60947-1:1991/A11 • EN 60947-4-1:1992, EN 50019:1978+A1 to A5
Certificate 2	<ul> <li>Special test certificate from the DMT-BVS in acc. with:</li> <li>DIN VDE 0660, DIN VDE 0165</li> <li>EN 60947-1:1991+A11:1994, EN 60947-4-1</li> <li>EN 50014:1994, EN 50019:1978 + A1 to A5</li> <li>EU directive 94/9/EC (ATEX 100a - EU directive)</li> </ul>

DMT-BVS	The DMT-BVS is, like the PTB, a certified German testing organization in compliance with the EU directive 76/117/EEC and EIExV. Like the PTB and other testing institutes in Europe, the DMT-BVS tests and awards certificates in acc. with the explosion protection directive 94/9/EC and is accredited accordingly. Over 100 years ago, the DMT-BVS became the first testing station for explosion protection in Germany, and it has been a testing station for electrical equipment as well since 1912. DMT-BVS certificates are recognized throughout the world. For support in export matters, the DMT-BVS works with the chemical industry and is of course recognized by it.
КЕМА	KEMA, which is a testing institute that enjoys worldwide recognition, is a certified European institute with many years of experience of testing for explosion protection. For support in export matters, KEMA also works with testing stations throughout the world.

## 1.2 Overview: Range of devices

#### **SIRIUS** system

The SIRIUS product range consists of 3RV circuit breakers, 3RT contactors, 3RH/3RT auxiliary contactors and contactor relays, 3RU thermal overload relays, 3RB10/3RB12 electronic overload relays, 3RP time relays, 3RW3 semiconductor motor control devices (referred to below as soft starters), and combinations of these devices, which form the 3RA load feeders.

The individual devices are developed and built in such a way that it is very easy to put them together to make load feeders. This is possible because the devices are all built to work together on both an electrical and a mechanical level.

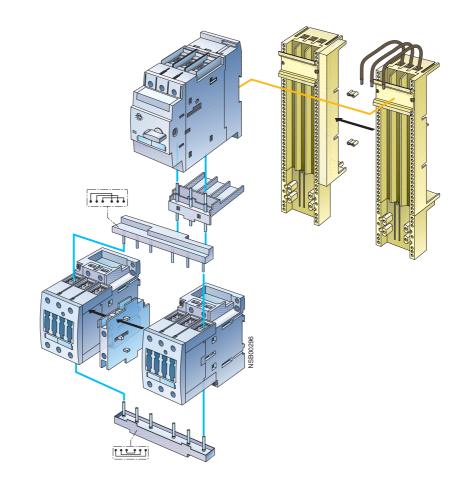

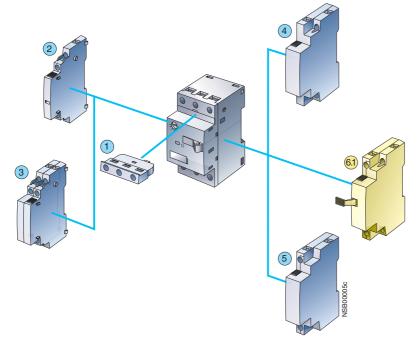

Figure 1-1: SIRIUS system

#### Circuit breaker with a frame size of S00 and attachable accessories:

Figure 1-2: Circuit breaker, accessories (frame size S00)

#### Circuit breakers with frame sizes of S0, S2, and S3 and attachable accessories:

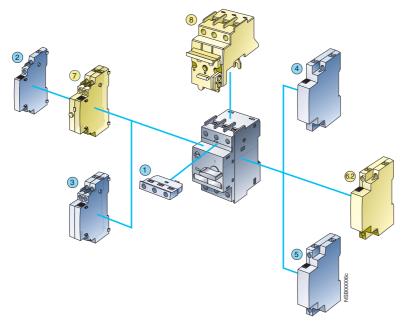

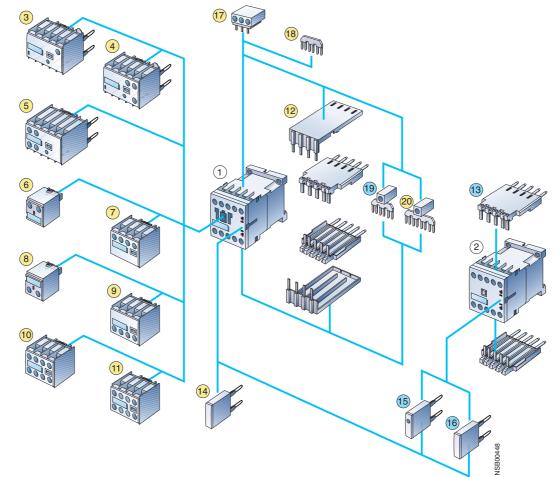

Figure 1-3: Circuit breakers, accessories (frame sizes S0, S2, and S3)

Attachable accessories for frame sizes S00, S0, S2, and S3:

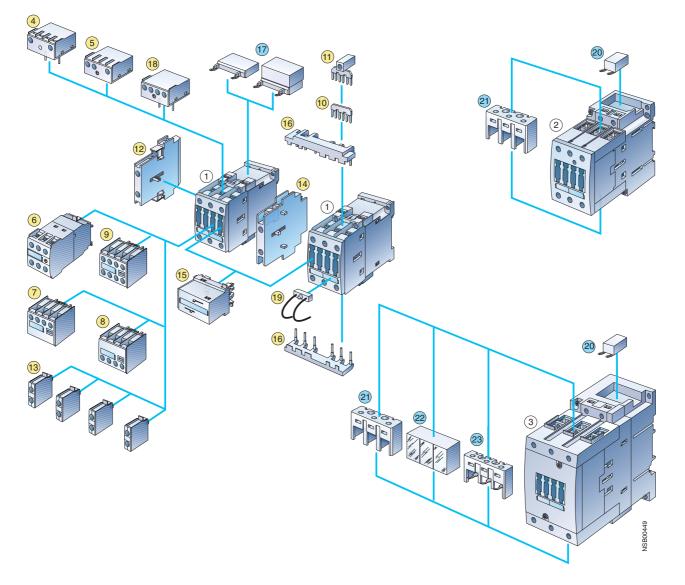

- 1) Transverse auxiliary switch
- 2) Lateral auxiliary switch with 2 contacts
- 3) Lateral auxiliary switch with 4 contacts
- 4) Shunt release
- 5) Undervoltage release
- 6.1)Undervoltage release with leading auxiliary contacts (S00)
- 6.2)Undervoltage release with leading auxiliary contacts (S0 to S3)
- 7) Alarm switch (S0 to S3)
- 8) Disconnecting module (S0 and S2)

Contactors with a frame size of S00 and accessories:

Figure 1-4: Contactors, accessories (frame size S00)

- 1) Contactor
- 2) Contactor relay
- 3) Solid-state time relay block, on-delay
- 4) Solid-state time relay block, off-delay
- Auxiliary switch block, time-delay (on-delay or off-delay or star-delta function)
- 6) 1-pole auxiliary switch block, infeed from above
- 7) 2-pole auxiliary switch block, infeed from above
- 8) 1-pole auxiliary switch block, infeed from below
- 9) 2-pole auxiliary switch block, infeed from below
- 10) 4-pole auxiliary switch block (terminal markings in acc. with DIN EN 50 012 or DIN EN 50 005)11) 2-pole auxiliary switch block, standard or electronic
- type (terminal markings in acc. with DIN EN 50 005)
- 12) Soldering pin adapter for contactors with 4-pole auxiliary switch block
- 13) Soldering pin adapter for contactors and contactor relays
- 14) Additional load module to increase the permissible residual current
- 15) Surge suppressor with LED
- 16) Surge suppressor without LED
- 17) 3-phase feed-in terminal
- 18) Parallel link (neutral bridge), 3-pole, without terminal
- 19) Parallel link, 3-pole, with terminal
- 20) Parallel link, 4-pole, with terminal

#### Contactors with frame sizes of S0 to S3 with accessories:

Figure 1-5: Contactors, accessories (frame sizes S0 to S3)

- 1) Contactor, frame size S0
- 2) Contactor, frame size S2
- 3) Contactor, frame size S3

#### For frame sizes S0 to S3:

- 4) Solid-state time relay block, on-delay
- 5) Solid-state time relay block, off-delay
- 6) Auxiliary switch block, time-delay (on- or off-delay or star-delta function)
- 7) 2-pole auxiliary switch block, infeed from above
- 8) 2-pole auxiliary switch block, infeed from below
- 9) 4-pole auxiliary switch block (terminal markings in acc. with DIN EN 50 012 or DIN EN 50 005)
- 10) Parallel link (neutral bridge), 3-pole, without terminal
- 11) Parallel link, 3-pole, with terminal

- 12) 2-pole auxiliary switch block, attachable on the right or left side (terminal markings in acc. with DIN EN 50 012 or DIN EN 50 005)
- 13) 1-pole auxiliary switch block (a maximum of 4 can be snapped on)
- 14) Mechanical interlock, attachable at the side
- 15) Mechanical interlock, attachable at the front
- 16) Wiring blocks above and below (reversing mode)
- 17) Surge suppressor (varistor, RC element, diode combination), attachable above or below (varies for S0 and S2/S3)
- 18) Coupling link for direct connection to the contactor coil
- 19) LED block to display contactor function

#### For frame sizes S2 and S3 only:

20) Terminal for contactor coil for setting up contactor combinations

21)Terminal cover for box terminals

#### For frame size S3 only:

22)Terminal cover for terminal end and bar connection

23) Auxiliary connecting lead terminal, 3-pole

# 1.3 System features

	The entire SIRIUS range of devices is divided up into only four frame sizes (S00 up to 5.5 kW, S0 up to 11 kW, S2 up to 22 kW, and S3 up to 45 kW) with three different widths (45 mm for S00 and S0, 55 mm for S2, and 70 mm for S3) and has a uniform range of accessories for all frame sizes.
Modular system	The individual components of the SIRIUS range are building blocks in a mod- ular system that are harmonized in terms of both their frame size and their technical specifications. This ensures that individual requirements can be met quickly and cost-effectively.
Uniformity	<ul><li>The devices are harmonized with regard to their ratings and their technical specifications:</li><li>The same width ensures rapid installation.</li><li>The terminal systems are standardized, and devices with the same rated current have the same terminals.</li></ul>
Performance capability	All SIRIUS devices can be mounted side by side without derating in an ambi- ent air temperature of up to 60 °C.
Accessories	All accessories, such as the auxiliary switches and surge suppressors, can be mounted and removed without tools. You can use link modules that connect devices both mechanically and elec- trically to put together combinations of devices and build fuseless load feed- ers.
Communication	<ul> <li>Direct communication with a higher-level controller is possible using:</li> <li>The AS-Interface load feeder module</li> <li>The ET 200X distributed I/O devices on the PROFIBUS-DP bus system</li> <li>The ET 200S system</li> </ul>

• The ET 200S system

# **1.4 Components and combinations**

This section describes the components of the SIRIUS system and the device combinations that are possible with these components.

#### Components of the SIRIUS system

The following table contains a list of the components of the SIRIUS system together with the most important accessories:

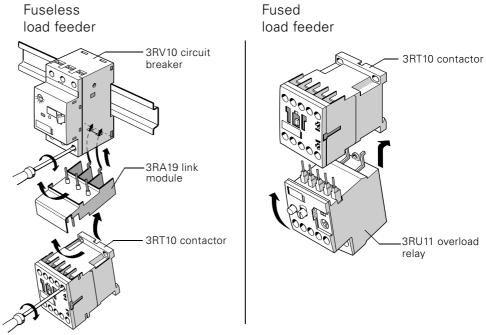

Components	Brief description/features	Accessories
3RV1 circuit breakers	- Switch and protect motors and other loads up to 100 A	<ul> <li>Auxiliary switches (transverse, lateral)</li> <li>Undervoltage releases</li> <li>Shunt releases</li> <li>Alarm switches</li> <li>Housing</li> <li>3-phase busbar system</li> </ul>
3RT10 motor contac- tors	<ul> <li>Switch motors up to 4 kW and currents up to 95 A</li> <li>Types: 3-pole for switching</li> <li>4-pole, with 4 NO and 2 S + 2 NC contacts</li> <li>Soldering pin adapter</li> <li>Capacitor switching contactor</li> <li>Reversing and star-delta combinations</li> </ul>	<ul> <li>Auxiliary switch blocks</li> <li>Surge suppressors</li> <li>Parallel links</li> <li>Time relay blocks</li> <li>Link modules</li> <li>Wiring blocks</li> </ul>
3RH11 contactor relays	<ul> <li>Same type of construction as the 3RT</li> <li>Basic version: 4-pole, expandable to 8 pins by means of auxiliary switch blocks</li> <li>High contact stability (1 mA; 17 V)</li> </ul>	
3RT10/3RH11 contactor relays	- Switch motors and auxiliary contactors with an extended operating range (17 V to 30 V)	
3RU11 overload relays	<ul> <li>CLASS 10</li> <li>Phase loss sensitivity</li> <li>Series auxiliary contacts 1 NO + 1 NC contact</li> <li>Frame size S00: repetition terminal for the auxiliary contact and coil connection for attachment to contactors</li> <li>Integrated, transparent and sealable cover for the adjusting knob and test function</li> </ul>	<ul> <li>Remote RESET, electrical</li> <li>Mechanical RESET</li> <li>Terminal bracket for stand-alone installation</li> </ul>
3RB10 overload relays	<ul> <li>CLASS 10 and CLASS 20</li> <li>Rapid tripping operation in the event of phase loss (&lt; 3 s)</li> <li>Series auxiliary contacts 1 NO + 1 NC</li> <li>Low power loss, energy-saving</li> <li>Wide adjustment ranges for simple configura- tion, selection, and less storage</li> <li>Extremely low energy requirements, approx. 50 mW</li> </ul>	<ul> <li>Remote RESET, electrical</li> <li>Mechanical RESET</li> <li>Terminal bracket for stand-alone installation</li> </ul>

Components	Brief description/features	Accessories
3RB12 overload relays	<ul> <li>CLASS 5 to CLASS 30 can be set</li> <li>Phase loss sensitivity</li> <li>2 outputs per 1 NO + 1 NC contact</li> <li>Integrated current transformers in all sizes</li> <li>Motor protection due to the connection of a thermistor sensor circuit</li> <li>Internal ground fault monitoring</li> <li>Overload warning</li> <li>Remote and automatic reset possible</li> <li>High tripping accuracy</li> <li>Wide adjustment ranges</li> <li>Self-monitoring</li> </ul>	<ul> <li>Summation current transformer for external ground fault monitoring</li> <li>DC adapter</li> <li>Terminal cover</li> </ul>

Table 1-1: Components and combinations with accessories

#### **Device combinations**

The following diagrams show you the possible device combinations, using the S00 frame size as an example:

3RA13 reversing combination

3RA14 star-delta combination

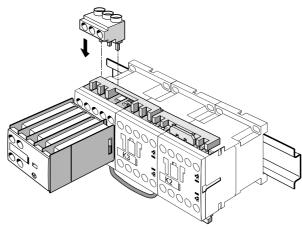

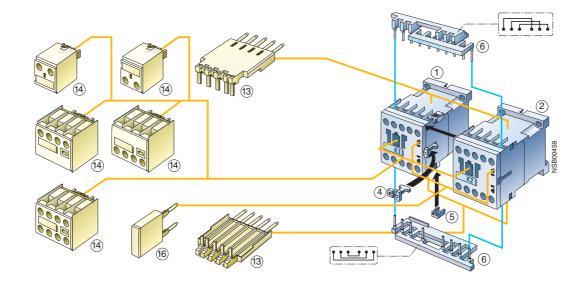

Figure 1-6: Device combinations

#### Contactor combination for reversing the S00 frame size (with accessories):

Figure 1-7: Contactor combination for reversing

Individual parts: 1/2) Contactors 4/5/6) Kit

The kit includes:

4) Mechanical interlock

5) 2 connection clips for 2 contactors

6) Wiring blocks above and below to connect the main conducting paths with electrical interlock (NC contact interlock - can be removed if required)

#### Attachable accessories:

- 13) Soldering pin adapter
- 14) Auxiliary switch block, on the front (only an auxiliary switch blocks that complies with DIN EN 50 005 can be used)
- 16) Surge suppressor

# 1.5 Mounting methods and terminal systems

### 1.5.1 Mounting the equipment

The method of mounting the equipment is uniform within each frame size.

Frame size	Mounting	Removal
S00 to S3	Screwed on	Removed with a screwdriver
S00, S0	Snapped onto a 35 mm rail (in acc. with DIN EN 50 022)	Removed without a tool
S2	Snapped onto a 35 mm rail (in acc. with DIN EN 50 022)	The snap-on spring can be opened with a screwdriver
S3	Snapped onto a 35 mm rail (in acc. with DIN EN 50 022) Snapped onto a 75 mm rail	The snap-on spring can be opened with a screwdriver

Table 1-2: Mounting methods

Screw-on mounting	<ul> <li>The SIRIUS switching devices can be screwed on to a flat surface.</li> <li>Please note the following points with some of the devices:</li> <li>3RV1 circuit breaker, frame sizes S00/S0: Push-in lugs are required for screw-type mounting</li> <li>3RP15 time relay: Push-in lugs are required for screw-type mounting</li> <li>Coupling links: No screw-type mounting</li> <li>Soft starters: No screw-type mounting</li> </ul>
Snap-on mounting	The SIRIUS switching devices are snapped onto 35 mm rails in acc. with DIN EN 50 022 without a tool. The devices with a frame size of S3 require a rail with an installation height of 15 mm. Alternatively, they can also be snapped onto 75 mm rails.

Frame size	Procedure	Illustration
S00/S0	Place the device on the upper edge of the rail, and press it down- wards until it snaps onto the lower edge of the rail.	
S2/S3	Place the device on the upper edge of the rail, and tilt it towards the rail until it snaps onto the lower edge of the rail.	

The following table shows you how to mount the device onto the rail:

Table 1-3: Mounting the device on the rail

Frame size	Procedure	Illustration
S00/S0	Push the device downwards to release the tension of the mounting spring, and remove the device by tilting it.	
S2/S3	Using a screwdriver, push the clip on the lower rear side of the device downwards to release the tension of the mounting spring (1), and remove the device by tilting it (2).	

The following table shows you how to remove the device from the rail:

Table 1-4: Removing the device from the rail

You will find notes on mounting the different devices on the rail in the relevant parts of section n.5 on mounting methods and terminal systems.

#### 1.5.2 Screw-type terminals

	The terminals used do not vary within a frame size. The current switched by the different devices of a single frame size does not vary either. This means you can use the same tool, torque, and conductor cross-section for the cir- cuit breakers, contactors, and overload relays of a single frame size. The stripped lengths are also the same. This is important in the case of prefabri- cated wiring.
Screw-type terminals	All the devices have screw-type terminals, either a terminal with a top washer or a box terminal, depending on the frame size. Devices with frame sizes S00 and S0 have terminals with captive screws and terminal washers that enable you to connect 2 conductors, even if they have different cross-sections. The box terminals of frame size S2 and S3 can also take 2 conductors with different cross-sections.
Connection tools	<ul> <li>Use the following tools to make the connection:</li> <li>Frame sizes S00 to S2: Screws are available for rated currents of up to 50 A for Pozidriv2 screwdrivers.</li> <li>Frame size S3: To obtain the required torques for the frame size for up to 100 A, the screws have a 4 mm hexagon socket.</li> <li>The screwdriver guides allow screwdriving machines to be used.</li> </ul>
Lugs and connecting bars	You can remove the box terminals from the devices with a frame size of S3 to connect conductors with lugs or connecting bars. A terminal cover is available as shock protection and to ensure that you comply with the required creepages and clearances when the box terminals are removed. You can find a detailed description in section n.4 on accessories.

#### 1.5.3 Cage Clamp terminals

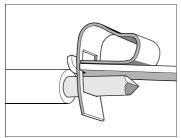

The Cage Clamp<sup>®</sup> terminal system is now available for circuit breakers, contactors, overload relays, and time relays.

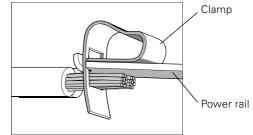

Cage-type clamping units, known as Cage Clamp terminals in the case of SIRIUS products, facilitate quick and maintenance-free wiring.

#### Design

The Cage Clamp terminal consists of two parts:

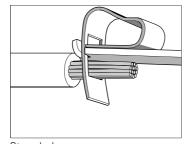

- A power rail for conducting current
- A sprung cage-type clamp for clamping strength

Single-core

Finely stranded

Stranded Figure 1-8: Cage Clamp terminal

Conductors

The Cage Clamp terminal on the switching devices clamps all copper wires (single-core, stranded and finely stranded) from  $0.25 \text{ mm}^2$  to  $2.5 \text{ mm}^2$ . The conductors can be clamped directly or with some protection for splicing. To this end, wire end ferrules or pin-end connectors can be placed on the conductor ends. The best solution is an ultrasonically condensed conductor.

Safety	The devices are equipped with a two-wire connection. In other words, there are two independent connections for each conducting path. Only one conductor is connected to each clamping unit. The clamp presses the conductor against the power rail, which is curved at this point. The high specific compressive load thus achieved is gas-tight. The clamp presses its flat surface against the conductor, thus avoiding dam- age to it. The spring force of the clamp is designed so that it automatically adjusts to the radius of the conductor. This allows any deformation of the conductor to be dealt with. It is not possible for the clamping unit to loosen by itself. This connection is vibration- and shock-proof. These types of stress do not damage the conductor or cause any loss in contact. Machines and systems in which this type of stress occurs, such as vibrators and elevators, are particularly suitable applications for this connection.
Transfer accuracy	The contact pressure between the conductor and power rail is optimal, mak- ing this clamp terminal suitable for high-voltage installations and also for the transfer of voltages and currents in the mV and mA ranges in measuring technology and electronics.
Tool	Screwdrivers can be obtained from the NSK (low-voltage switchgear) cata-

log for opening the Cage Clamp terminals.

Procedure

The following table shows you how to use the Cage Clamp:

Step	Procedure	
1	Insert the screwdriver into the rectangularopening until it stops. The screwdriver head auto- matically keeps the clamp open.	
2	Insert the conductor into the oval terminal opening.	NSJ DODE
3	Remove the screwdriver. The terminal closes, and the conductor is thus secu- rely clamped.	NS. I DODOS

Table 1-5: How to use a Cage Clamp terminal

#### Small conductor crosssections

With conductor cross-sections that are  $\leq 1 \text{ mm}^2$ , you have to use an insulating stop to ensure the conductors remain securely clamped. The illustration below shows the procedure:

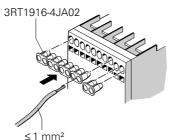

Figure 1-9: Conductor cross-sections ≤ 1 mm<sup>2</sup>

#### 1.5.4 Connection cross-sections

Because SIRIUS is a modular system, the connection cross-sections are the same for all devices of a single frame size.

The following tables specify the permissible conductor cross-sections for main and auxiliary conductor connections:

	Main and auxiliary conductors		
Ø 5 to 6 mm/PZ2	0.8 to 1.2 Nm 7 to 10.3 lb.in	Cage Clamp	
	2 x (0.5 to 1.5 mm <sup>2</sup> ) 2 x (0.75 to 2.5 mm <sup>2</sup> )	2 x (0.25 to 2.5 mm <sup>2</sup> )	
	2 x (0.5 to 1.5 mm <sup>2</sup> ) 2 x (0.75 to 2.5 mm <sup>2</sup> )	2 x (0.25 to 1.5 mm <sup>2</sup> )	
		2 x (0.25 to 2.5 mm <sup>2</sup> )	
AWG	2 x (18 to 14)	2 x (24 to 14)

### 1.6 Communication

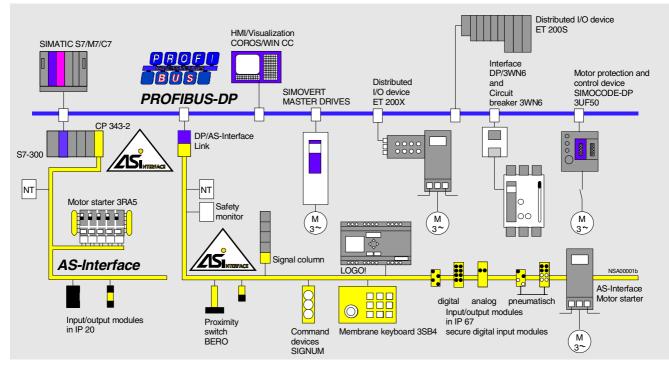

Figure 1-10: Communication

### 1.6.1 Communication-capable low-voltage switching technology

This uniform range of communication-capable Siemens switching devices represents an innovative concept for effective cubicle automation. Communication with the higher-level control system via open, PROFIBUS-DP, and AS-Interface connections.

Actuator-sensor interface (AS-Interface) AS-Interface is a standardized, non-proprietary networking system (IEC 62026-2) for simple and usually binary actuators and sensors. It is possible to connect it to SIMATIC programmable logic controllers via different master modules. A DP/AS-Interface link also ensures direct integration in a PROFIBUS-DP system or connection to other field buses via couplers. Up to 248 sensors and 186 actuators can be connected to an AS-Interface network over a maximum of 500 m. Safety-related signals can now also be networked with AS-Interface, thus dispensing with the wiring of emergency stop signals that was needed previously.

**PROFIBUS**PROFIBUS is a standardized, non-proprietary field bus system (IEC 61158)<br/>to which most PLCs of leading manufacturers can be connected. Up to 125<br/>nodes can be incorporated in one bus segment. Distances of up to 9.6 km<br/>can be bridged with copper cables and up to 100 km with fiber-optic cables.

# **PROFIBUS-DP** PROFIBUS-DP (DP being a German abbreviation for distributed I/O) is used for switching devices with higher communication requirements (e.g. the transmission of analog actual values with extremely fast response times). It is also used to link individual AS-Interface segments.

### 1.6.2 Parameterization of PROFIBUS-DP and bus-capable low-voltage switching devices

Before commissioning, PROFIBUS-DP must be configured, and the individual bus nodes must be parameterized. There are user-friendly tools available to the user for configuration and parameter assignment.

Parameter assignment tools

- For SIMATIC S7 masters, all the functions are integrated in the STEP 7 programming language.
- For SIMATIC S5 masters and various non-Siemens masters, the COM PROFIBUS parameter assignment software is required.
- Manufacturers of non-Siemens masters offer other configuration and parameter assignment programs.

## Applications The above program packages make it easy to carry out the following for PROFIBUS-DP and its nodes:

- Configuration
- Parameter assignment
- Documentation
- Commissioning
- Testing
- Diagnostics

For additional information on communication-capable low-voltage switching devices, as well as system components and accessories, see the following catalogs:

- ST 70 "S7, M7 and C7 Programmable Logic Controllers"
- IK PI "Industrial Communication and Field Devices"

### 1.6.3 Actuator-sensor interface (AS-Interface)

The actuator-sensor interface (AS-Interface) is a modular networking system for sensors and actuators in the lowest field range.

It makes no difference to the program in the programmable controller whether parallel wiring with input/output modules or AS-Interface is used. It is therefore possible for existing systems to change to AS-Interface because you can continue to use the same programs. The entire system can be operated without additional software. It is not necessary to be familiar with the internal workings of AS-Interface.

Replacement for the cable harness	Process signals that occur in situ, are normally transferred to the open loop control using extensive parallel wiring and input/output modules. This means that each sensor or actuator in the field is connected to the input/ output modules with its own cable. AS-Interface makes it possible to replace this cable harness with a simple two-wire cable for all sensors or actuators.
Data and power on a two-wire cable	The master communicates with the nodes via the AS-Interface cable. As well as data, this cable also transfers the supply voltage for the electronic components and sensors. The voltage is supplied to the AS-Interface cable from a special AS-Interface power supply unit with a data link.
Setting up different structures	The AS-Interface cable is laid in the same way as for an electrical installa- tion. A new feeder can be inserted at any point. This makes it possible to set up network structures (e.g. tree, star or line structures). No shielding or ter- minating resistors are required. The wiring can be adapted individually to the system or machine.
Maximum system con- figuration	Detailed configuration and installation guidelines can be found in the instal- lation guideline "Montage des Vernetzungssystems AS-Interface" (on mount- ing the AS-Interface networking system). Up to 62 nodes can be connected to the AS-Interface cable. A node is, for example, an AS-Interface module (digital or analog) or a BERO (proximity switch) with an integrated AS-Interface chip. A maximum of 4 binary stan- dard sensors and/or 4 actuators can be connected to an AS-Interface mod- ule. This produces a maximum configuration of 248 sensors and 186 actuators (62 nodes x 4 inputs and 3 outputs).
IP 67 degree of protection	AS-Interface is a networking system for direct use on the machine. The AS- Interface user compact modules have IP 67 protection. They can be used in situ without being enclosed. There are also AS-Interface modules for use with IP 20 protection in the cubicles or distributed switchboxes.

New installation system	All compact modules are placed on a mounting plate. The mounting plate takes the AS-Interface cable and keeps it in place. Polarity reversal is not possible due to the profile of the cable. The compact modules are simply hooked on at the top of the mounting plate and secured with just one screw. When you secure the modules, contact is made with the AS-Interface cable. You do not have to strip or screw on the cable.
Coding prevents errors	All the modules are mechanically and electrically coded. The coding system prevents errors occurring in the event of replacement. At replacement, only one module of the same type can ever be mounted. This stops digital or analog modules (or even inputs or outputs) getting mixed up.
Addressing	To participate in data transfer with the master, each node must be assigned an address before commissioning of the AS-Interface network. Addressing devices are available for this.
Addressing an installed module	There is an additional feature which makes new Siemens modules even more user-friendly: the addressing socket. Using this socket you can address a module after it has been installed. It is not necessary to unscrew the module. Installation can be carried out in the system by personnel who are not familiar with the AS-Interface. The com- missioning engineer can address the modules easily when they are already
	installed. For the first time, this type of addressing is also possible with IP 67 protection.
Diagnostics at a glance	The new generation of AS-Interface modules (compact modules, analog modules, and SlimLine modules) has the new display system developed by Siemens.
	The status of a module is displayed by two LEDs lighting up continuously or flashing. This simple diagnostic feature directly on the module makes it possible for the user to find the error quickly and efficiently. This in turn reduces down- times.
Certificates of the AS- Interface association	All Siemens AS-Interface products are tested in acc. with the relevant testing regulations in an accredited test laboratory and certified by the AS-Interface association.

Digital compact modules with IP 67 protection	The AS-Interface modules in the compact range are characterized by opti- mized operating features and improved user-friendliness. This can reduce mounting and commissioning times for AS-Interface by up to 40%. Additional LEDs provide information on the most important operat- ing modes of the module, resulting in a considerable increase in system availability. The modules of the compact range consist of two components: Mounting plate and compact module The mounting plate mechanically fixes the AS-Interface profile cables, takes the compact module, and serves as a template with drill holes. The compact module contains the electronic components for communica- tion and the M12 standard connections for inputs/outputs. Up to four sen- sors and four actuators can be easily and reliably connected to the compact module using the M12 standard connection. The mounting plate and compact module are only connected to each other by means of a single screw. Contact is established with the AS-Interface cable by means of the proven insulation displacement method. AS-Interface modules in the compact range that have an M12 connection can have a protective conductor (PE) connected to them. Using an addressing socket integrated in the compact module, you can also allocate addresses when the module is in place.
Analog compact mod- ules with IP 67 protection	The design of the analog modules has been adapted for the compact mod- ules. The analog input and output modules each have two channels. You can connect measuring sensors and analog actuators using standard M12 con- nectors. The following groups of analog modules exist: • Input module for two current sensors • Input module for two voltage sensors • Input module for two thermal resistors • Output module for two thermal resistors • Output module for two voltage actuators • Output module for two voltage actuators • Output module for two voltage actuators • All the measured values - except for the thermal resistance value of Pt 100 (not linear) - are available in linear form. In other words, the non-linear trans- mission curve of the thermal resistor sensor is automatically linearized in the analog module, and measured values can be processed directly in the programmable controller. The input and output channels are isolated. Two-wire and four-wire sensors can be connected. Differential inputs produce considerable suppression of common-mode interference. The integrating sigma-delta converter ensures high measurement accuracy.

Pneumatic compact modules with IP 65 and IP 67 protection	The pneumatic compact module is a highly integrated AS-Interface slave. As an input/output module that is entirely suitable for field deployment, it has four electrical inputs and two pneumatic outputs. The electrical inputs behave in the same way as the inputs of the digital input/output compact modules. Both integrated pneumatic outputs are implemented by means of two pre- set 4/2-way valves (2 to 8 bar; 550 NI/min) with a shared compressed-air supply and separate exhaust air collection and can be operated manually using separate slide valves. Two cylinders that work in tandem, for example, can be connected to a module in this range. Connections to AS-Interface are made via the standard mounting plate. The AS-Interface cable is inserted into the corresponding cable guides, and the upper part is secured to the mounting plate by means of a screw. The mod- ule is ready for use.
Safety first - emergency stop via AS-i	AS-Interface is the first system on the market that can transmit both stan- dard signals and safety-related input signals (e.g. emergency stop) via the same cable. Only an additional safety monitor and safe modules are required to use AS- Interface as a safety bus. This enables category 4 in acc. with EN 954-1 to be achieved. A failsafe programmable controller or special master is not nec- essary. The concept and implementation of AS-Interface Safety at Work (AS-Inter- face SaW) have been tested and certified by TÜV (technical testing associa- tion). This means that the system can be converted to the considerably more flex- ible AS-Interface network, which is already available, thus obviating the need for the complex, separately implemented emergency stop wiring that has been necessary up to now.

### 2.1 Specifications/regulations/approvals

Standards	<ul> <li>The 3RV1 circuit breakers comply with the specifications for circuit breakers in acc. with IEC 60947-2/DIN VDE 0660, Part 101.</li> <li>The circuit breakers for motor protection comply with the specifications in acc. with IEC 60947-4-1/DIN VDE 0660, Part 102.</li> <li>The auxiliary switches comply with IEC 60947-5-1/DIN VDE 0660 Part 200.</li> </ul>
Approvals/ test reports	Confirmation of approvals, test certificates, and characteristics can be obtained on the Internet/intranet.
Terminal markings	The terminal markings comply with DIN EN 50 011.
Utilization categories	Circuit breaker in acc. with IEC 60947-2: A Motor starter in acc. with IEC 60947-4-1: AC-3 (main conducting paths) DC - 11 / AC - 15 (control and auxiliary conducting paths)
Main and emergency stop switches	The specifications for the main and emergency switches comply with IEC 60204/DIN VDE 0113 Part 1.
Disconnector specifications	Disconnector specifications comply with IEC 60947-3.
Shock protection	3RV1 circuit breakers are shockproof in acc. with DIN VDE 0106 Part 100, even without accessories. You can find additional information on the subject of shock protection in the "Switching, Protection and Distribution in Low- Voltage Networks" manual, p. 37 ff.
Degree of protection	The degree of protection of the 3RV1 circuit breaker is IP 20. In the terminal area of frame sizes S2 and S3 the degree of protection is IP 00.
Characteristics	The time-current characteristics, the current limitation characteristics and the I <sup>2</sup> t characteristics have been determined in acc. with IEC 60947 and DIN VDE 0660.

Conditions of application

### **Explosion-proof motors**

KEMA test report no. EX-97.Y.3236 in acc. with EN 50 019:1977 +A1 to A5 and DIN VDE 0165 DMT certificate in acc. with directive 94/9 EC (ATEX) in preparation

### Nuclear power plants

KTA certificate

### **Railway vehicles**

DIN EN 50 155

### Ships and docks

Shipbuilding certificates of classes GL, LRS or DNV.

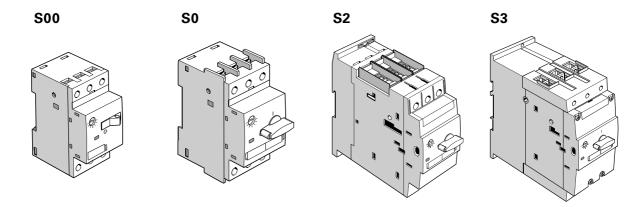

### 2.2 Device description

3RV1 circuit breakers are used to switch and protect three-phase induction motors of up to 45 kW at 400 VAC and for loads with rated currents of up to 100 A.

The 3RV1 circuit breakers have 3 poles. To achieve the highest degree of flexibility, auxiliary switches, alarm switches, auxiliary releases, and other accessories can be easily attached to the circuit breakers without tools, as required.

3RV1 circuit breakers and 3RT1 contactors are built to work together on both an electrical level and physically. This enables them to be easily and quickly put together to make load feeders.

**Frame sizes** 3RV1 circuit breakers are available in 4 frame sizes (S00 to S3).

The following table shows you the frame sizes and the corresponding maximum rated operational current at a voltage of 400 VAC. The last column in the table tells you which three-phase induction motor is suitable for which particular size.

Frame size	Width	Max. rated operational current	Output power of the three-phase induction motor
S00	45 mm	12 A	5.5 kW
<b>S</b> 0	45 mm	25 A	11 kW
S2	55 mm	50 A	22 kW
<b>S</b> 3	70 mm	100 A	45 kW

Table 2-1: Circuit breakers, frame sizes

### 2.2.1 General description

Fields of application	<ul> <li>The 3RV1 circuit breakers are suitable for:</li> <li>Motor and plant protection</li> <li>Transformer protection</li> <li>Starter protection (short-circuit protection)</li> <li>The 3RV16 11-0BD10 circuit breaker, frame size S00, is used for fuse monitoring.</li> </ul>
Releases	<ul> <li>3RV1 circuit breakers have:</li> <li>Inverse-time delay, thermal overload releases</li> <li>Instantaneous short-circuit releases</li> <li>The overload releases can be set to the load current.</li> <li>The short-circuit releases are set permanently to 12 times the rated current, which allows motors to start up without problems. Circuit breakers used for</li> </ul>
	transformer protection are set to 19 times the rated current to avoid being tripped by the high inrush current. When the circuit breakers are tripped, in the case of frame size S00 the tog- gle switch goes into the tripped position, and in the case of frame sizes S0 to S3 the rotary switch switches to the tripped position. Before it is switched on again, the rotary switch must be put in the 0 position manually to avoid switching to the fault inadvertently.
	In the case of circuit breakers with a rotary switch, the tripping operation can also be reported electrically by means of an alarm switch.
Tripping classes	In acc. with IEC 947-4-1: • Frame sizes S00 to S3: class 10 • Frame sizes S2/S3: class 20
Auxiliary release	<ul> <li>The circuit breakers can also be equipped with one of the following auxiliary releases:</li> <li>Shunt release</li> <li>Undervoltage release</li> <li>Undervoltage release with leading auxiliary contacts</li> </ul>
Auxiliary contact ele- ments	The circuit breakers can be equipped with a transverse auxiliary switch, an electronically optimized transverse auxiliary switch or a lateral auxiliary switch (Section 2.4 Accessories).
Shock protection	<ul> <li>Shock protection can be improved by covering the terminals and connections. This can be achieved with the following accessories:</li> <li>Frame size S00, S0: protective caps for transverse auxiliary switches</li> <li>Frame size S2, S3: terminal covers for box terminals</li> <li>Terminal covers for lug and bar connection</li> </ul>

### Other accessories

Other accessories for circuit breakers:

- Alarm switch
- Disconnecting module
- Isolated 3-phase busbar system
- Busbar adapter
- Rotary switches
- Terminals for "Combination Motor Controller Type E" in acc. with UL 508
- Housing and front plates

### 2.2.2 Operation

Setting the values

Using a screwdriver, set the load rated current (current setting)  ${\rm I_e}$  on the scale of the circuit breaker.

Note the two possible markings:

- Dash marking: marking for a circuit breaker in a stand-alone installation
- Triangle marking: marking for a circuit breaker in a side-by-side installation

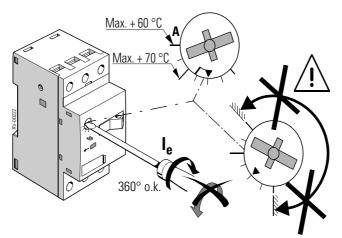

Figure 2-2: Setting the current setting  $\rm I_{e}$  (example: frame size S00)

### Warning

The adjusting knob can be turned 360° clockwise. You can only turn it counterclockwise within the adjustment range.

## Sealing the adjustment scale

You can prevent unauthorized adjustment of the current setting by placing a transparent cover over it and sealing it.

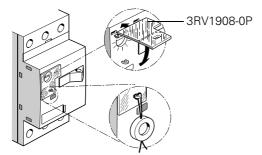

Figure 2-3: Sealing the adjustment scale (frame size S00)

### Switches

The state of the circuit breakers can be determined by the position of the switches:

Frame size	Switch	STOP	ON	Tripped
S00	Toggle switch	0	I	0
S0, S2, S3	Rotary switch	OFF	ON	Tripped

Table 2-2: Contact position indicators of the circuit breakers

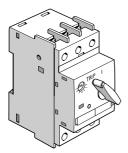

Figure 2-4: Tripped position, 3RV (frame size S0)

## Locking the circuit breakers

You can prevent the circuit breaker from being switched on by unauthorized persons by securing the switch drive (toggle switch or rotary switch) with a padlock (shackle diameter 3.5 to 4.5 mm).

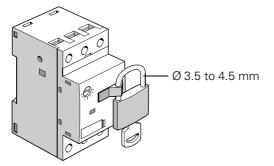

Figure 2-5: Locking the toggle switch (frame size S00)

### **Reclosing after a tripping operation**

After the circuit breaker has been tripped, the switch goes into the tripped position to indicate this. You use the switch to close the circuit again. In the case of frame sizes S0 to S3, the rotary switch must be put in the OFF position manually before it is switched on again to avoid switching to the fault inadvertently.

In the case of frame sizes S2 and S3, it is possible to switch on and off using a motorized remote-control mechanism (see Section 2.4, Accessories).

## Testing overload tripping

The following table shows you how overload tripping of the circuit breaker is tested:

Drawing	Step	Procedure
	1	Switch the toggle switch/rotary switch from 0 to 1.
	2, 3	Put a screwdriver in the test opening and push it to the left. Overload tripping is in working order when the toggle switch switches from 1 to 0 (frame size S00) or goes into the trip- ped position (frame sizes S0 to S3).

Table 2-3: Testing overload tripping (example: frame size S00)

### 2.2.3 Information on configuration

The short-circuit releases of the 3RV1 circuit breakers execute a three-phase Short-circuit protection isolation of the faulty load feeder from the network and prevent any further damage. With a short-circuit breaking capacity of 50 kA or 100 kA and a voltage of 400 VAC, the switches are considered to be short circuit-proof, since higher short-circuit currents are not to be expected where the switches are installed. Backup fuses are only required if the short-circuit current at the point of installation exceeds the rated short-circuit breaking capacity of the circuit breakers. You will find the short-circuit breaking capacity for other voltages and the size of any required fuse listed in Section 2.6, Technical specifications. Conditions of applica-3RV1 circuit breakers are climate-proof. They are intended for use in closed areas where there are no harzardous operating conditions such as dust, cortion rosive fumes or destructive gases. Appropriate housings are available as an accessory for use in dusty and damp areas (see Section 2.4). Inrush current Because the operational currents, the starting currents and the current spikes vary on account of the inrush current, even in motors of the same power, the motor powers listed in the tables are only guide values. Most important when selecting the correct circuit breakers are the concrete starting data and rating of the motor to be protected. This also applies to circuit breakers used for transformer protection.

Phase loss sensitivity	The phase loss sensitivity of the circuit breaker ensures that it is tripped in good time in the event of the loss of a phase and the resulting overcurrents in the other phases. During normal operation, the device should have a three-pole load. To pro- tect single-phase loads or direct current loads, all 3 main conducting paths should be switched in series.
Explosion protection	<b>Note</b> In the case of a three-pole load, at 5 to 8 times the set current, the release time deviates by a maximum of $\pm$ 20% and therefore complies with the requirement of DIN VDE 0165 and EN 50019: 1977 +A1 to A5 and DIN VDE 0165.
Characteristics	The tripping characteristic of the inverse-time delayed overload release (thermal overload release, a-release) is valid for direct current and alternat- ing current with frequencies of 0 to 400 Hz. The characteristics are valid for tripping operations from a cold state. From a warm state, the release times of the thermal releases are reduced to approximately 25 %.

The tripping characteristics of the instantaneous electromagnetic overcurrent releases (short-circuit release, n-release) is based on the rated current  $I_n$ , which in circuit breakers with adjustable overload releases is also the upper value of the adjustment range.

The following is a chart of the time-current characteristic:

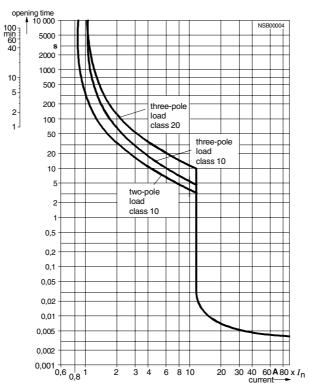

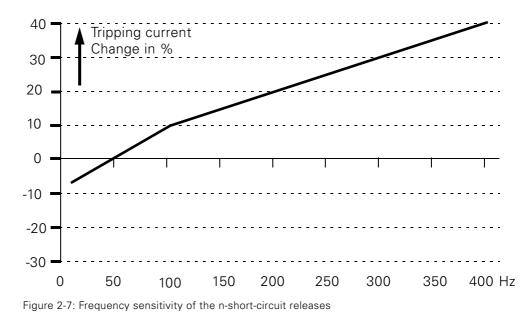

Figure 2-6: Time-current characteristic, chart

Time-current characteristics, current-limiting characteristics and l<sup>2</sup>t characteristics can be requested directly from your sales representative, if necessary.

## Frequency sensitivity of the short-circuit releases

The characteristics of the short-circuit releases apply to frequencies of 50/ 60 Hz. For lower frequencies, such as 16  $^{2}/_{3}$  Hz, for higher frequencies up to 400 Hz, and for direct current, appropriate correction factors have to be taken into account.

The following characteristic curve illustrates the frequency sensitivity of the short-circuit releases (calibrated to 12 times  $I_u$  +20%):

The increase in tripping current is approximately 30% for DC voltage.

**Frequency converters** The thermal switch disconnectors do not have to be corrected when you use frequency converters.

### 2.3 Field of application/variants

2.3.1 Motor protection	The tripping characteristics of the 3RV1 circuit breakers are designed prima- rily to protect three-phase induction motors. The circuit breakers are therefore also referred to as motor protecting switches. The 3RV1 circuit breakers for motor protection are limited to the protection of systems.
Set current	The current of the motor that is to be protected is set on the adjustment scale. The short-circuit release is set at the factory to 12 times the value of the rated current of the circuit breaker. This ensures problem-free startup and reliable protection of the motor.
Phase loss sensitivity	The phase loss sensitivity of the circuit breaker ensures that it is tripped in good time in the event of the loss of a phase and the resulting overcurrents in the other phases.
CLASS10/CLASS20	Circuit breakers of frame sizes S00 to S3 with thermal overload releases comply with tripping class 10 (CLASS 10). Circuit breakers with the CLASS 20 tripping characteristic are available for frame sizes S2 and S3 in difficult startup conditions.

### 2.3.2 Transformer protection

Inrush current	In the case of primary protection of control transformers, the high inrush currents that occur when the transformers are switched on often result in the unwanted tripping of the protective devices. The 3RV1 circuit breakers with frame sizes S0 and S2 therefore have over- current releases for the protection of transformers that are set at the factory to approximately 19 times the rated current. This makes it possible to pro- tect transformers in which the inrush currents reach peak values of up to 30 times the rated current with circuit breakers in the primary circuit. In the case of 4AM control transformers with low inrush current (Siemens control transformers, for example), this is not required. 3RV1 circuit brea- kers can be used here for motor protection.
2.3.3 Starter protection	The 3RV13 starter protection switches are circuit breakers without overload releases. They are used together with a contactor and overload relay if the circuit breaker is not to be triggered in the case of overload tripping.

### 2.3.4 Circuit breakers with overload relay function

Circuit breakers with the 3RV11 overload relay function are available for frame sizes S0, S2, and S3.

Description

Circuit breakers with the overload relay function contain overload releases that do not affect the breaker mechanism of the circuit breakers. In the event of an overload, the circuit breaker remains switched on. To protect the following loads, 2 auxiliary contacts (1S + 1Ö) are attached on the right side. These are operated in the event of an overload. The auxiliary switch function can be evaluated or used to disconnect a downstream contactor. After the circuit breaker has cooled down, the auxiliary contacts are reset automatically.

### Caution

In the overload range, the circuit breaker does not protect itself with the overload relay function. You must therefore ensure that the circuit breaker is safely disconnected by means of a downstream switching device (e.g. a contactor).

## Fixed link: auxiliary contacts with circuit breaker

Diagrams

### Note:

The auxiliary contacts are connected to the circuit breaker on the right side and cannot be removed.

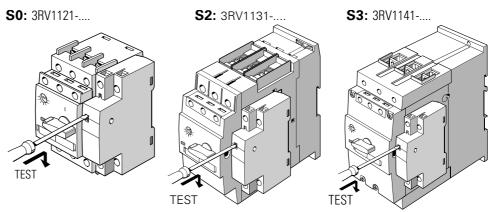

Figure 2-8: Circuit breaker with overload relay function (frame sizes S0 to S3)

### 2.3.5 Fuse monitoring

The 3RV16 11-0BD10 circuit breaker is used with frame size S00 for fuse monitoring.

A conducting path of the circuit breaker is switched in parallel for each fuse. If one fuse fails, the current flows via the parallel-switched conducting path of the circuit breaker and trips it.

$\wedge$	<b>Warning</b> Fuse monitoring using the 3RV1611-0DB10 circuit breaker is not permissible in feeders with power control regulators where a DC feedback with higher values can occur in the event of a fault.		
Auxiliary switch func- tions	The circuit breaker used for fuse monitoring can be equipped with a trans- verse or lateral auxiliary switch (Section 2.4, Accessories). The auxiliary switch reports the tripping of the circuit breaker and thus the failure of the fuse and initiates an all-pole disconnection of the problem circuit by a corre- sponding switching device.		
Safety sign	<b>Note</b> When fuses used for isolation purposes are monitored, a warning sign must be put up next to them. Via the parallel-switched voltage circuit of the moni- toring facility, voltage may get into the area that is supposed to be isolated if the monitoring equipment has not bee disconnected.		
	We suggest the following text for the warning: Attention To ensure isolation, also disconnect the fuse-monitoring device with the item designation		
Voltages	<ul> <li>The 3RV1611-0DB10 circuit breaker is suitable for fuse monitoring in the following voltage ranges:</li> <li>24 to 690 VAC, 50/60 Hz</li> <li>24 to 250 VDC, 100 to 600 VDC</li> <li>Switching capacity I<sub>CN</sub> 100 kA</li> </ul>		
Circuit diagrams	Ue         AC 24 690V         DC 24 250V         DC 100 600V           Image: Comparison of the state of the sta

I» I» I»

I» I» I»

Parallel cables/meshed<br/>networksAttentionIn the case of parallel cables and meshed networks, a tripping operation and<br/>report only occurs when the voltage difference at the circuit breaker is at

### 2.3.6 Switching direct current

least 24 V.

The 3RV1 circuit breakers for alternating current are suitable for switching direct current. However, you must note the maximum permissible DC voltage per conducting path. In the case of higher voltages, series connection of 2 or 3 conducting paths is required.

# **Response thresholds** The response thresholds of the overload releases remain unchanged. The response thresholds of the short-circuit releases are increased with direct current by approximately 40%. The following table lists suggestions for switching direct current:

Suggestion	Circuit breaker	Frame size	Max. permissible direct voltage E <sub>l</sub>	Meaning
	3RV1.	S00 to S3	150 VDC	2-pole switching Ungrounded system If a ground fault can be excluded, or if every ground fault is immediately corrected (ground-fault monitoring), the maximum per- missible DC voltage can be tripled.
	3RV1.	S00 to S3	300 VDC	2-pole switching Grounded system The grounded pole must always be assigned to the individual conducting path so that in the event of a ground fault there are always 2 conducting paths in series.
	3RV1.	S00 to S3	450 VDC	<ul><li>1-pole switching</li><li>Grounded system</li><li>3 conducting paths in series.</li><li>The grounded pole should be assigned to the unswitched conducting path.</li></ul>

Table 2-4: Suggestions for switching direct current

### Double ground fault

#### Note

In the case of the circuit with 2-pole switching and an ungrounded system, it is assumed that even in the event of a double ground fault that bridges two contacts, safe disconnection still occurs.

### 2.3.7 Main and emergency stop switches

Since the circuit breakers meet the requirements for disconnectors in acc. with IEC 60947-3 and the additional test requirements for circuit breakers with disconnector features in acc. with IEC 60947-2, they can be used with the appropriate accessories as main and emergency stop switches. They must also comply with DIN VDE 0113.

### 2.4 Accessories

### 2.4.1 Attachable accessories: Overview

Auxiliary switches, alarm switches, auxiliary releases and other accessories can be easily attached to the circuit breakers without tools, as required.

Accessories	Function/use	Width	Attach to
Transverse auxi- liary switch	<ul> <li>The contacts of the auxiliary switches close and open together with the main contacts of the circuit breaker. Variants:</li> <li>1 changeover contact</li> <li>1 NO + 1 NC contact</li> <li>2 NO contacts</li> </ul>	Width of the cir- cuit breaker remains the same	Front
Electronically optimized trans- verse auxiliary switch	One transverse auxiliary switch can be attached for each circuit breaker: Variants: • 1 changeover contact		
Lateral auxiliary switch	<ul> <li>One lateral auxiliary switch can be attached for each circuit breaker:</li> <li>1 NO + 1 NC contact</li> <li>2 NO contacts</li> <li>2 NC contacts</li> <li>2 NO + 2 NC contacts</li> </ul>	9 mm 18 mm	Left side
Alarm switch Frame sizes S0, S2 and S3	<ul> <li>One alarm switch can be attached at the side of the circuit breakers with rotary switches.</li> <li>The alarm switch has two contact systems: <ul> <li>One contact system (1 NO + 1 NC) reports a general tripping operation, irrespective of whether it was caused by a short circuit, overload or auxiliary release.</li> <li>The other contact system (1 NO + 1 NC) only switches in the event of a short circuit tripping operation.</li> </ul> </li> <li>To reclose the circuit breaker after a short circuit, the alarm switch must be reset manually after the cause of the error has been eliminated.</li> </ul>	18 mm	
Shunt release	<ul> <li>Remote release of the circuit breaker:</li> <li>Via PLC: The coil of the release should be connected to the voltage only briefly</li> <li>Especially suitable for emergency stop disconnection by means of appropriate emergency stop switches in acc. with DIN VDE 0113</li> </ul>	18 mm	Right side Accessories cannot be attached on the right of a circuit
Undervoltage release	Trips the circuit breaker in the event of a voltage interruption (e.g. when the power plug is removed) and prevents the motor starting up inadvertently when the voltage returns.		breaker with a relay func- tion.
Undervoltage release with lea- ding auxiliary con- tacts 2 NO	Function and use, see undervoltage release. Additional function: The auxiliary contacts isolate the undervoltage release from the power system on both sides in the event of breaking or a tripping operation and thus prevent voltage distortion to the control circuit when the switch is in the off position. It is possible to reclose the circuit breaker because the contacts reclose.		

Accessories	Function/use	Width	Attach to
<b>Disconnecting</b> <b>module</b> Frame sizes S0 and S2	The supply is fed to the circuit breaker via the disconnecting module. A connector which can only be removed when the circuit breaker is switched off isolates the circuit breaker from the power system on 3 poles. The shock-protected isolation position is easily visible and is secured by a padlock to ensure that the connector cannot be used during maintenance work, for example.	Width of the cir- cuit breaker remains the same	Upper side
Motorized remote-control mechanism For frame sizes S2 and S3	The circuit breakers can be opened and closed via the remote-con- trolled mechanism by means of electrical commands. This enables a load or system to be disconnected from and then reconnected to the power system from an operator control panel. The circuit breaker can be disconnected from and reconnected to the remote-control mechanism in situ.		
Rotary switch extension for the door	The rotary switch extension for the door consists of a knob, a drive coupling and an extension shaft. They comply with IP 65. The door interlock prevents the cubicle door being opened inadvertently when the switch is in the on position. The off position can be secured with a maximum of 3 padlocks.		
Emergency stop rotary switch extension	Rotary switch extension with emergency stop function.		

Table 2-5: Attachable accessories

### 2.4.2 Auxiliary switch, alarm switch, and auxiliary release

The maximum configuration for each 3RV1 circuit breaker is one transverse auxiliary switch, one lateral auxiliary switch, one alarm switch, and one auxiliary release.

### **Possible combinations**

The following combinations of auxiliary switches and alarm switches or of auxiliary switches are possible:

- Auxiliary and alarm switches can be installed individually or together. The lateral auxiliary switch is installed on the left of the alarm switch.
- Transverse and lateral auxiliary switches can be combined.
- One auxiliary release can be attached on the right for each circuit breaker:

Mounting the auxiliary switches

The auxiliary switches, alarm switches, and auxiliary releases are mounted in the same way for all frame sizes:

### Transverse auxiliary switch (3RV1901-1D, -1E, -1F)

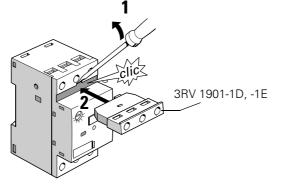

Figure 2-10: Mounting the transverse auxiliary switch (frame size S00)

### Lateral auxiliary switch (3RV1901-....) Undervoltage release (3RV1901-....)

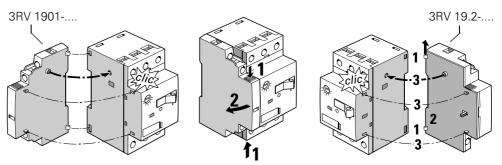

Figure 2-11: Mounting/removing the lateral auxiliary switch/undervoltage release (frame size S00)

### Voltage ranges of the auxiliary releases

One undervoltage release or shunt release can be installed for each circuit breaker. The following voltage ranges are possible:

Auxiliary release	Frequency	
Undervoltage release	AC 50 Hz	AC 60 Hz
	24 V	
	110 V	120 V
		208 V
	230 V	240 V
	400 V	
	415 V	480 V
Undervoltage release	230 V	240 V
with leading	400 V	
auxiliary contacts	415 V	480 V
Shunt release	AC 50/60 Hz 100% duty cycle <sup>1)</sup>	AC 50/60 Hz; DC 5 sec. duty cycle <sup>2)</sup>
	20 V - 24 V	20 V - 70 V
	90 V - 110 V	70 V - 190 V
	210 V - 240 V	190 V - 330 V
	350 V - 415 V	330 V - 500 V
	500 V	-

Table 2-6: Voltage ranges of the auxiliary releases

1) Transformer operational voltage of the lower mark of the voltage range at 0.85 (Tu = 60  $^{\circ}$ C) is valid for 100% (continuous) duty cycle <u>only</u> at AC 50/60 Hz

2) Transformer operational voltage of the lower mark of the voltage range at 0.9 (Tu = 60 °C) is valid for 5 seconds duty cycle at AC 50/60 Hz and DC

## Mounting the alarm switch

The following table explains how the 3RV19.2-.... alarm switch is mounted onto the circuit breaker:

Drawing	Step	Procedure
3RV 19.2 3 3 3 4 3 4 5 6 6 6 6 6 6 6 6 6 6 6 6 6	1	Press and hold down the trans- port safety button on the inside of the alarm switch.
	2	Then press the blue RESET but- ton on the front of the alarm switch.
	3	Hook the alarm switch onto the circuit breaker.
	4	Move the alarm switch towards the circuit breaker until you hear it click into place.

Table 2-7: Testing overload tripping (example: frame size S0)

### Alarm switch signals

The alarm switch has two signals:

- TrippedShort circuit

The following table lists the signals, the status of the alarm switch, and the procedure required:

Drawing	Status	Procedure
	<b>Tripped signal</b> Tripped position LED: Red RESET button (blue): remains depressed	Switch off (0 position) Switch on again (I position)
	Short circuit Tripped postion LED: red RESET button (blue): not depressed	Switch off (0 position) Switch on again (I position) RESET button (blue): press

Table 2-8: Alarm switch with tripped signal and short circuit signal

### 2.4.3 Motorized remote-control mechanism

The motorized remote-control mechanism is available for 230 VAC, 50 Hz and 24 VDC

- Frame size S2: I<sub>nmax</sub> = 50 A
  Frame size S3: I<sub>nmax</sub> = 100 A

Mounting and connec-	The following table shows you how to mount and connect the motorized
tion	remote-control mechanism:

Drawing	Step	Procedure
2 I AUTOMATIC MANUAL	1	Remove the Allen key from the cover of the circuit breaker.
	2	Use the Allen key to change the selector switch to "Manual".
	3, 4	Undo the 2 screws and remove the cover.
	5, 6	Undo the 4 screws on the remote- controlled mechanism, and remove it. (Pozidriv 2).

Drawing	Step	Procedure
	7	Screw the frame onto the mount- ing surface using 4 screws (M5).
M5 (4 x) 7 S2: M4/S3: M5 S2: M4/S3: M5 9 9 9 9 9 9 9 9 9 9 9 9 9	8, 9	Attach the circuit breaker using 2 screws. Attention: Use screws 14 mm in length.
	10	Attach the ground wire.
SRV1921-1M MANUAL RESET 12 12 12 12 12 12 12 12 12 12 12 12 12	11	Connect the main and control wires to the circuit breaker.
	12	If desired, set MANUAL RESET: Remove the screw from the RESET lever.
	13-15	Put the remote-control mecha- nism module into place, making sure that the driver covers the knob on the circuit breaker, and screw it on.

Drawing	Step	Procedure
17 Uc 16 20 20 20 20 21 21 22 21 21	16-18	Screw the control wires for the remote-control mechanism onto the connector, and insert it.
	19	Set the current.
	20, 21	Put the cover on, and screw it tightly.
	22	Use the Allen key to switch to AUTOMATIC and replace the Allen key in the cover.

Table 2-9: Mounting the remote-control mechanism (frame size S2)

### Warning

Do **not** set the "Automatic" position or operate the remote-control mechanism when open! There is a risk of injury!

If used as an emergency stop, it is not permissible to switch on manually.

**Manual RESET** 

Remove the screw from the RESET lever (step 12)

### 2.4.4 Disconnecting module

The disconnecting module is suitable for creating a visible isolating distance. The isolating connector can only be removed in a deenergized state. The isolating distance can be secured with padlocks when open. Disconnecting modules are available for the circuit breakers of frame sizes S0 and S2.

Mounting sequence for the disconnecting module and lateral auxiliary switch

### Attention

The disconnecting module covers the terminal screws of the transverse auxiliary switch. We therefore recommend that you use the lateral auxiliary switches or that you only install the disconnecting module once the transverse auxiliary switch has been wired.

### Locking

Disconnecting modules can be mounted on the circuit breakers of every frame size. The modules are mounted in the same way for frame sizes S0 and S2. The following diagrams show you how to mount the disconnecting module for frame size S0 (3RV1928-1A):

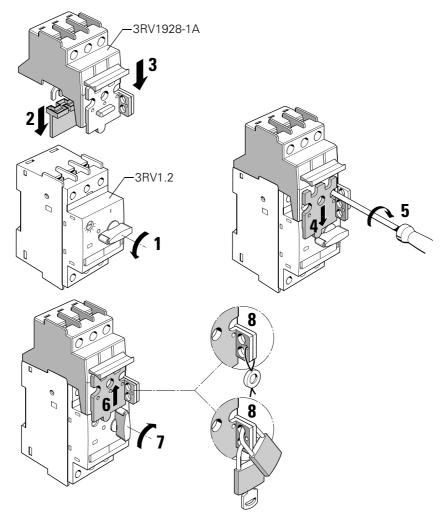

Figure 2-12: Mounting the disconnecting module (frame size S0)

## Disconnecting and locking

The disconnecting module can be locked and sealed or secured with two padlocks if the connector is removed during maintenance work, for example. The circuit breaker itself can also be secured with a third padlock.

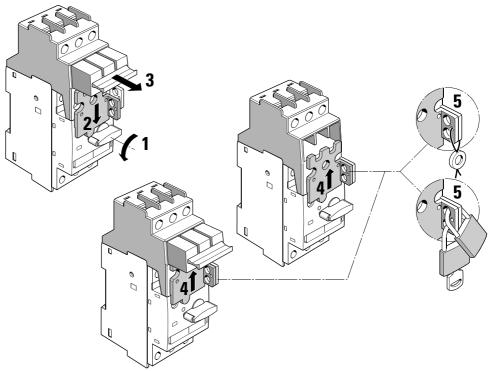

Figure 2-13: Locking the disconnecting module (frame size S0)

## Terminal cover (frame size S2)

A terminal cover (3RT1936-4EA2) is available for the disconnecting module in frame size S2 (3RV1938-1A) that protects the contacts from dirt and provides additional shock protection.

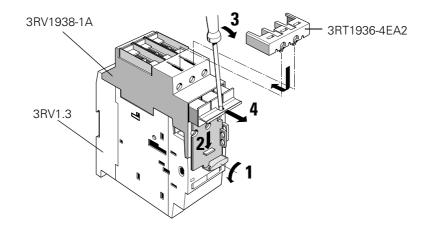

Figure 2-14: Locking the disconnecting module and mounting the cover (frame size S2)

### 2.4.5 Rotary switch extension for door

Rotary switch extensions for doors are available for frame sizes S0, S2, and S3. They consist of a lockable rotary switch with a detachable door coupling, a 150 mm long extension shaft, and a connector for the switch drive. The door handle complies with IP 65.

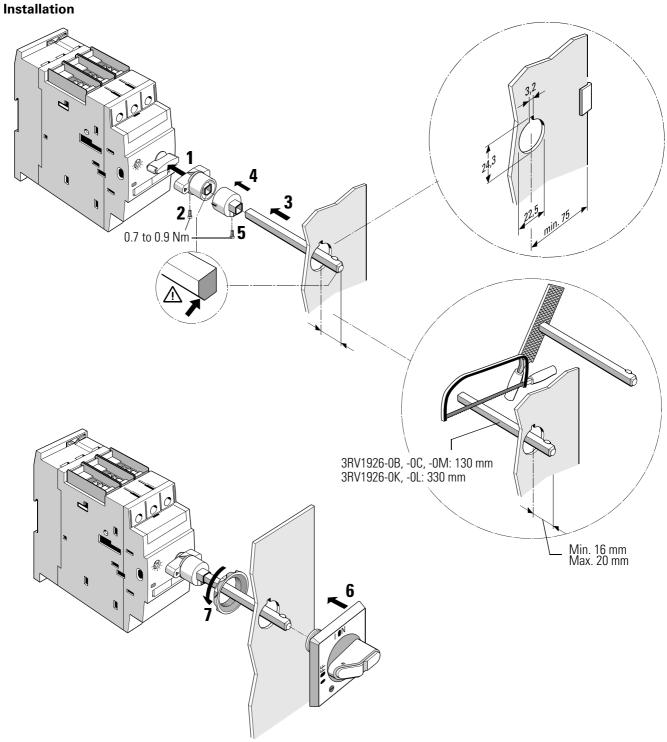

Figure 2-15: Mounting the rotary switch extension for the door (frame size S2)

### Opening the door

The following table shows you how the cubicle door can be opened using the rotary switch extension for the door:

Drawing	Procedure
	To open the cubicle door, set the circuit breaker to O (OFF). This releases the extension shaft from the rotary switch and allows the door to be opened.
	If you want to open the cubicle door during operation, you can override the procedure by press- ing the button at the side of the rotary knob (step <b>1</b> ). To close it during operation, press the button again so that the exten- sion shaft snaps into place again.

Table 2-10: Opening a cubicle door using the rotary switch extension

Opening the door with great force

#### Note:

If the circuit breaker is in the ON position and the door is opened with a force >150 N to 200 N, the cap of the extension shaft is separated from the rotary switch of the circuit breaker to prevent the circuit breaker being destroyed.

The circuit breaker remains in the ON position.

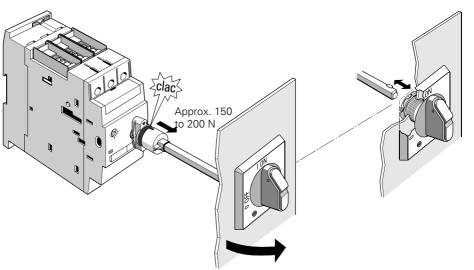

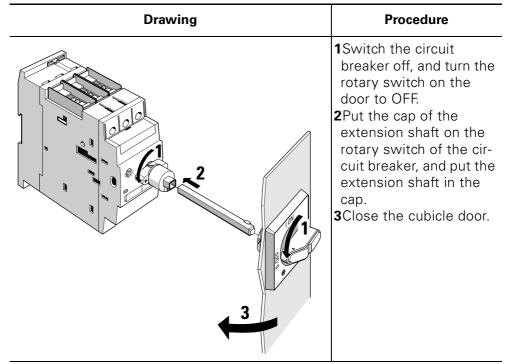

Figure 2-16: Operating the rotary switch extension for the door

The extension shaft must then be remounted on the circuit breaker and the rotary switch extension for the door as follows:

Table 2-11: Mounting the extension shaft

Security

When the rotary switch is in the OFF position, it can be secured with up to 3 padlocks (e.g. during maintenance work on the system).

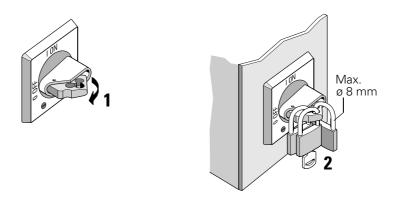

Figure 2-17: Locking the rotary switch extension for the door

#### 2.4.6 Terminals for "Combination Motor Controller Type E" in acc. with UL 508

Since July 16, 2001, 1 inch air clearance and 2 inch creepage distance is required for "Combination Motor Controller Type E" on the input side in acc. with UL 508. Use terminal blocks 3RV1928-1H and 3RT1946-4GA07 for the 3RV10 circuit breakers in frame sizes S0 and S3. The 3RV10 circuit breaker in frame size S2 complies with the required air clearance and creepage distance without a terminal block. Terminal blocks are not required for use in acc. with CSA. These terminal blocks cannot be used in the S0 frame size at the same time as the 3RV19.5 3-phase busbars or in the S3 frame size at the same time as a transverse auxiliary switch.

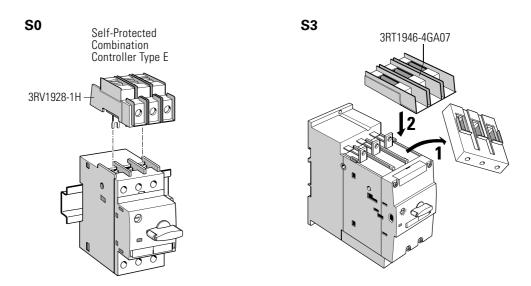

Figure 2-18: Terminals for "Combination Motor Controller Type E"

#### 2.4.7 Housings and mounting accessories

Molded-plastic housings (IP 55) are available if you want to install circuit breakers as single units. All the housings are equipped with neutral and ground terminals. Above and below are two openings that can be knocked out for cable glands. On the back of the housing there are 2 precut openings. All the cable bushings have metric dimensions. The surface casings can be sealed. There is space in the housing on the rail for additional modular terminal blocks.

Model	Molded-plastic 	Width	Frame size
Housing with actuator membrane for toggle switch	Surface casing	54 mm, 72 mm	S00
	Вау	72 mm	S00
Lockable housing with rotary switch	Surface casing	54 mm, 72 mm 82 mm	S0 S2
	Вау	72 mm	SO
Lockable housing with emergency stop rotary switch (red/ yellow)	Surface casing	54 mm, 72 mm 82 mm	S0 S2
	Вау	72 mm	SO

Table 2-12: Housings for circuit breakers

#### Widths

The widths of the housing depend on whether auxiliary releases are used:

- 54 mm: circuit breaker + lateral auxiliary switch
- 72, 82 mm: circuit breaker + lateral auxiliary switch + auxiliary release

Mounting the surface casing

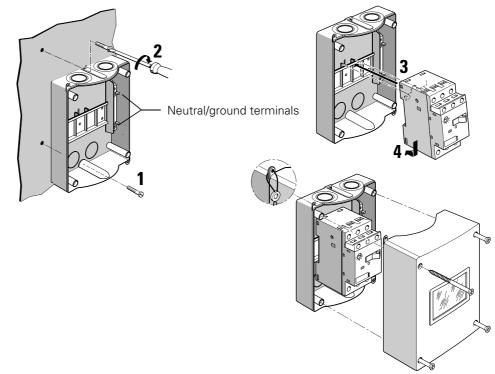

Figure 2-19: Molded-plastic surface casing (frame size S00)

#### Mounting the bay

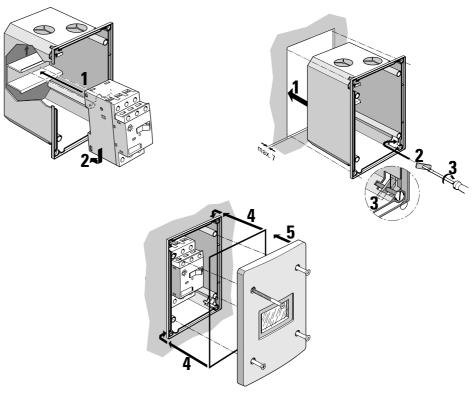

Figure 2-20: Molded-plastic bay (frame size S00)

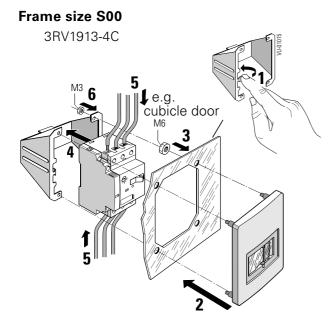

#### Front plates

Molded-plastic front plates that have IP 55 protection are suitable for any housing:

Front plates and accessories	Model	Frame size
Front plates	With actuator membrane and support for switch	S00
	With lockable with rotary switch	S0, S2, S3
	With lockable emergency-stop rotary switch (red/ yellow)	S0, S2, S3
Accessories	Support for front plate	S0

Table 2-13: Front plates for any housings

#### Mounting the front plates

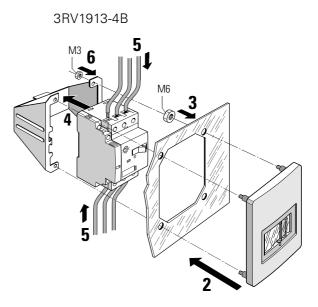

Figure 2-21: Mounting the front plate (frame size S00)

#### Frame size S0

3RV1923-4. + 3RV1923-4G

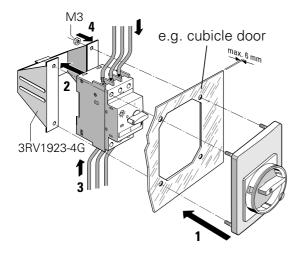

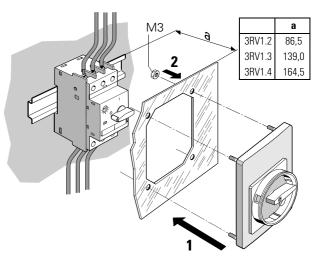

Figure 2-22: Mounting the front plate (frame size S0)

3RV1923-4.

#### Accessories for the housings and front plates (S00)

The following accessories are available for the housings and front plates of the circuit breakers in frame size S00:

- Replacement actuator membrane
- Locking device for 3 padlocks
- Emergency-stop button (red/yellow)
- Emergency-stop button (red/yellow) with safety lock

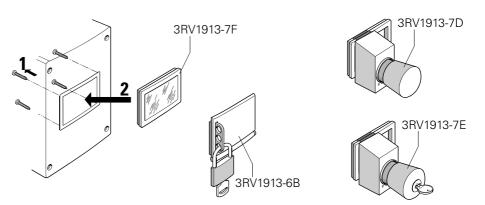

Figure 2-23: Accessories for the housings and front plates (frame size S00)

#### Locking device

The locking device can be used on the inside of the housings or front plates. To do this, remove the frame of the actuator membrane. The locking device can be secured with up to 3 padlocks that can prevent the circuit breaker from being switched on during maintenance work, for example.

#### **Emergency-stop button**

The emergency-stop button is attached to the actuator membrane. When hit, the circuit breaker is switched off and the button locks into position. You can release the button by turning it or using a key. The circuit breaker can then be switched on again.

#### **Indicator lights**

Indicator lights are available for the housings and front plates of circuit breakers in frame sizes S00, S0, and S2. They contain a glow lamp and red, green, yellow, orange, and transparent lenses. Indicator lights are available for the following voltage ranges: 110-120 V, 220-240 V, 380-415 V and 480-500 V.

#### Installation

There is a precut opening on the front of the housing that can be knocked out to install an indicator light:

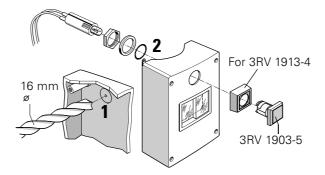

Figure 2-24: Indicator light installation in a molded-plastic housing

#### 2.4.8 Busbar adapter

To enable the circuit breakers to be mounted without using up too much space, and to ensure that the infeed is economical in terms of both time and money, the switches are mounted directly onto busbar systems using busbar adapters.

The circuit breakers are snapped onto the adapter and connected at the input side. This prepared unit is mounted directly onto the busbar systems, thus both attaching it mechanically and establishing electrical contact.

#### **Busbar systems** The adapters are suitable for the following systems:

Busbar systems with	For copper busbars in acc. with DIN 46 433				
center-to-center spacing	Width	Depth			
40 mm systems	12 mm and 15 mm	5 mm and 10 mm			
60 mm systems	12 mm to 30 mm	5 mm and 10 mm			

Table 2-14: Busbar systems

Accessories

The following accessories are available for busbar adapters:

- Modules that can be mounted on either side to widen the adapters
- Busbar holder for 3 rails
- Molded-plastic covers for 3 terminals (40 mm system)
- Molded-plastic cover profiles for shock protection

# **Measurements** The following table lists the dimensions of the busbar adapters and accessories.

System	Busbar adapter and accessories	Length	Width	For circuit breakers in frame size
40 mm	Circuit breaker + lateral auxiliary switch	121 mm	45 mm 55 mm	S00, S0
	Circuit breaker	139 mm	55 mm	S2
	Circuit breaker	182 mm	70 mm 72 mm	S3 (up to 400 V) S3 (up to 690 V)
	Side module	139 mm 182 mm	13.5 mm 13.5 mm	S2 S3
60 mm	Circuit breaker	182 mm	45 mm	S00, S0
		182 mm	55 mm	S2
		182 mm	70 mm 72 mm	S3 (up to 400 V) S3 (up to 690 V)
	Side module	182 mm	13.5 mm	S00 to S3

Table 2-15: Dimensions of the busbar adapters and accessories

# Link module for circuit breaker and contactor

Link modules are needed to make electrical and mechanical connections between the circuit breaker and contactor to form a load feeder. Link modules are available for the following combinations:

Actuating voltage of contactor	Frame size of contactor	For circuit breakers of frame size
AC and DC	S00	S00
	S00	SO
	SO	SO
	S2	S2
	S3	S3

Table 2-16: Link modules for connecting circuit breakers to contactors

You can find additional information about load feeders on busbar systems in Chapter 5, "Fuseless load feeders".

# Mounting circuit breakers on busbars

The following illustrations show you how to mount circuit breakers in frame sizes S00 and S0 onto busbar adapters (8US1..1-5D) and how to remove them again, using frame size S00 as an example:

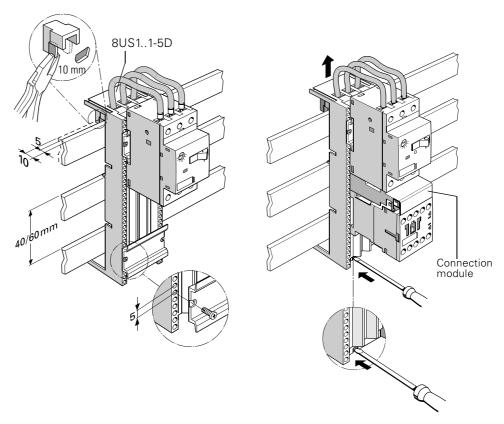

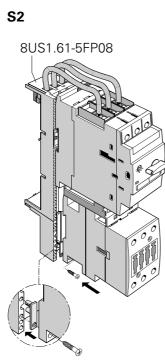

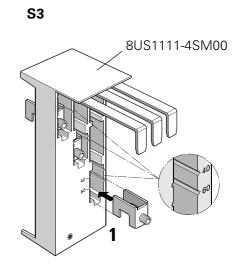

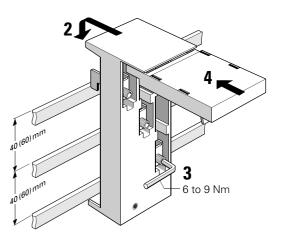

Figure 2-25: Mounting circuit breakers on busbar adapters (frame sizes S00 and S0)

Mounting circuit breakers on a busbar system The following illustrations show you how to mount circuit breakers in frame sizes S2 and S3 onto a busbar adapter:

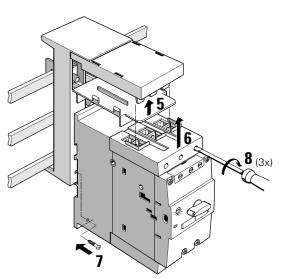

Figure 2-26: Mounting circuit breakers on busbar adapters (frame sizes S2 and S3)

# Mounting accessories

The following illustration shows you how to mount accessories for busbar adapters for frame sizes S00 to S2:

- Side module
- Device holder
- Extension piece
- Outgoing terminal rail (for frame sizes S00 and S0 only)

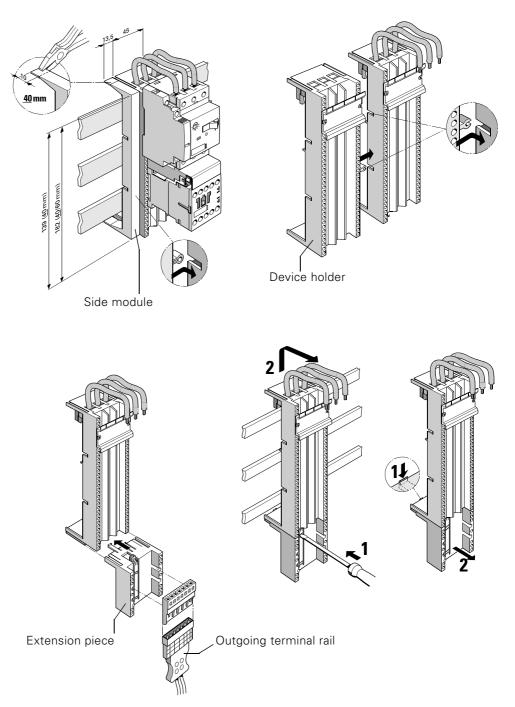

Figure 2-27: Accessories for busbar adapters (frame sizes S00 to S2)

#### 2.4.9 Isolated 3-phase busbar system

3-phase busbars are used to snap circuit breakers of frame sizes S00, S0, and S2 quickly and easily in a row onto a rail. There is only one power supply, via a feed-in terminal.

The 3-phase busbar systems are safe from fingers and are shock protected. They are rated for the short-circuit stress that can occur on the output side of the connected circuit breakers.

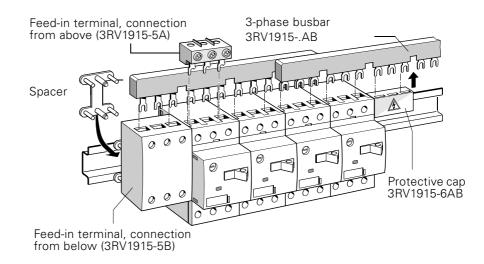

Figure 2-28: 3-phase busbar system

# Rated operational voltage/current

Rated operational voltage	690 V
Rated current	Frame sizes S00, S0: 63 A
	Frame size S2: 108 A
	1

Table 2-17: Rated operational voltage/current

#### Models

The 3-phase busbars take 2 to 5 circuit breakers, depending on the model. There are busbars with more generous spacing for circuit breakers with accessories attached on the side.

Frame size of the circuit breaker	Spacing	Models
S00, S0	45 mm	For 2, 3, 4, or 5 circuit breakers
	55 mm	For 2, 3, 4, or 5 circuit breakers + accessories
	63 mm	For 2 or 4 circuit breakers + accessories
S2	55 mm	For 2, 3, or 4 circuit breakers
	75 mm	For 2, 3, or 4 circuit breakers + accessories

Table 2-18: Types of 3-phase busbars

Combination of frame sizes S00 and S0	Circuit breakers in frame sizes S00 and S0 vary in height and depth and therefore <b>cannot</b> be combined on one busbar. You can combine two busbars for circuit breakers in frame sizes S0 and S00 using an extension piece.

### 2.5 Mounting and connection

#### 2.5.1 Mounting

**Mounting position** 

You can install the 3RV1 circuit breakers anywhere.

Snap-on mounting

The circuit breakers are mounted by snapping them onto 35 mm rails that comply with DIN EN 50 022. The circuit breakers with a frame size of S3 require a rail with an installation height of 15 mm. Alternatively, they can also be snapped onto 75 mm rails.

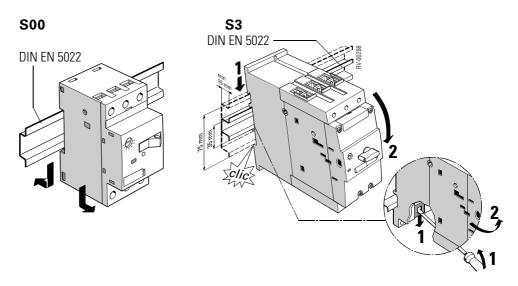

Figure 2-31: Mounting the circuit breakers onto the rail

Screw-on mounting

The circuit breakers are attached to a flat surface with 2 screws. For circuit breakers in frame sizes S00 and S0, two push-in lugs (3RB1900-0B) (pack of 10) are also required.

Circuit breakers in frame sizes S2 and S3 can be screwed directly onto a base plate.

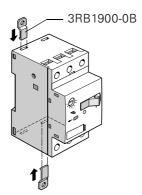

Figure 2-32: Screw-on mounting of the 3RV1 (example: frame size S00)

#### 2.5.2 Connection

Tools	<ul> <li>You require the following to connect the circuit breakers:</li> <li>Frame sizes S00 to S2: Pozidriv 2 screwdriver</li> <li>Frame size S3: Allen key (4 mm)</li> </ul>
Conductor cross-sec- tions	The typical SIRIUS conductor cross-sections apply (see Section 1.5.2 "Con- ductor cross-sections").
Screw-type terminals	3RV1 circuit breakers with frame sizes S00 and S0 have terminals with cap- tive screws and terminal washers that enable you to connect 2 conductors, even if they have different cross-sections.
	The box terminals of the circuit breakers of frame sizes S2 and S3 can also take 2 conductors with different cross-sections. With the exception of circuit breakers of frame size S3, which have terminal screws with a 4 mm Allen screw, all the terminal screws can be tightened using a standard screwdriver or a Pozidriv screwdriver (size 2).
	You can remove the box terminals from circuit breakers with a frame size of S3 to connect conductors with lugs or connecting bars. A terminal cover is available as shock protection and to ensure that you comply with the required creepages and clearances when the box terminals are removed.
Soldering pin connec- tor	Circuit breakers in frame size S00 can be soldered onto printed circuit boards by means of a soldering pin connector. A soldering pin connector is available for the main contacts and the transverse auxiliary switch.

#### Mounting the soldering pin adapters

The soldering pin adapters are clamped above and below in the screw-type terminals of the circuit breakers. Alternatively, the power supply can be taken to the printed circuit boards via cables.

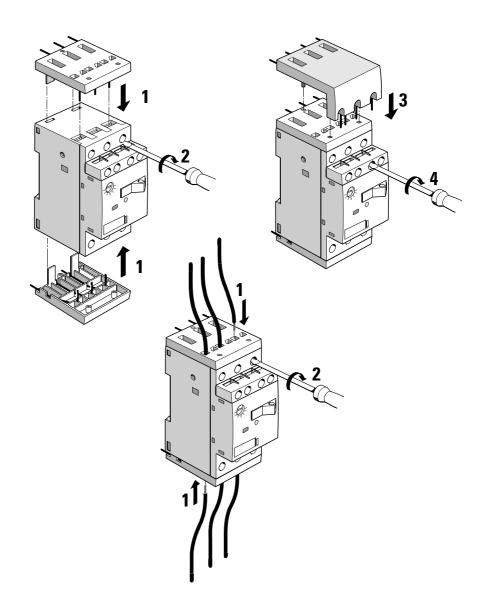

Figure 2-33: Circuit breaker, soldering pin connector (frame size S00)

#### Permissible rating of approved devices for North America, 🖲 🏽

The circuit breakers in the SIRIUS 3RV1 series are approved for **(1)** and can also be used in acc. with UL 508 and C22.2 No.14 with a contactor as a load feeder. You can use these circuit breakers as a "Manual Motor Starter" for "Group Fusing" or for "Group Installation" or as a "Combination Motor Controller **Type E**".

#### 3RV1 circuit breaker as a "Manual Motor Starter"

When the circuit breaker is used as a "Manual Motor Starter", it is always with a device for short-circuit protection (upstream short-circuit protection device). Any fusible link ("group fusing") or circuit breaker ("group installation") can be used as a device for short-circuit protection. The type and size are selected in acc. with the American NFPA 70 standard, Article 430-53 (c) for adequate protection of supply lines.

Accreditation was issued under the following file numbers with the listed data:

Hp rating = output power in horse power (maximum motor power)  $\mathsf{FLA}$  = full load amps

1) Corresponds to "short circuit breaking capacity" in acc. with UL

#### Permissible rating of approved devices for North America, ® @

#### 3RV10.A circuit breaker as "Combination Motor Controller Type E"

Since 16.07.2001, 1 inch air clearance and 2 inch creepage distance is required for a "Combination Motor Controller Type E" on the input side with UL 508 The 3RV10 circuit breaker in frame sizes S0 and S3 are therefore approved with the terminal blocks listed below in acc. with UL 508.

The 3RV10 circuit breaker in frame size S2 already complies with the required air clearance and creepage distance as a basic unit. These extended air clearances and creepage distances are not required for CSA. The terminal blocks are therefore not required for use as a "Combination Motor Controller Type E" in acc. with CSA. 3RV10 circuit breakers are certified as "Combination Motor Controller **Type E**" under the following file numbers with the listed data:

File No. E156943, Product Class NKJH

S File No. LR12730, Product Class 3211 08

		Q300	R300	R300

#### 2.7.2 Rated short-circuit breaking capacity I<sub>cn</sub> in acc. with IEC 60 947-2

The table lists the rated limit short-circuit breaking capacity  $I_{cu}$  and the rated service short-circuit breaking capacity  $I_{cs}$  of 3RV1 circuit breakers with different inception voltages and related to the rated current  $I_n$  of the circuit breakers.

The incoming supply of the circuit breakers is permissible at the upper or lower terminals irrespective of the rating.

If the short-circuit current at the installation location exceeds the rated short-circuit breaking capacity of the circuit breaker specified in the table, a backup fuse is required. You can also use an upstream circuit breaker with a limiter function.

The maximum rated current of this backup fuse is specified in the tables. The rated short-circuit breaking capacity specified for the fuse then applies.

Circuit breaker/contactor combinations for short-circuit currents of up to 50 kA can be used as fuseless load feeders in acc. with Part 5.

#### 2.7.3 Limiter function with standard devices for 500 VAC and 690 VAC in acc. with IEC 60 947-2

The table lists the rated limit short-circuit breaking capacity  $I_{cu}$  and the rated service short-circuit breaking capacity  $I_{cs}$  with an upstream standard circuit breaker that fulfills the limiter function at 500 VAC and 690 VAC.

The short-circuit breaking capacity can be significantly increased using the upstream standard circuit breaker with a limiter function. The circuit-breaker connected downstream, should be set to the rated current of the load. Be sure when you set up circuit breaker combinations to note to the distances between the grounded parts and the distances between the circuit breakers. Make sure that the cabling between the circuit breakers is short circuit-proof. You can set up the circuit breakers side by side.

### 3.1 Specifications/regulations/approvals

Regulations	<ul> <li>The following regulations apply to contactors:</li> <li>IEC 60 947-1, EN 60 947-1 (VDE 0660 Part 100), which includes the general specifications for low- voltage switching devices.</li> <li>IEC 60 947-4-1, EN 60 947-4-1 (VDE 0660 Part 102), which contains, in particular, the requirements for contactors and motor starters.</li> <li>The following regulations apply to auxiliary contactors:</li> <li>IEC 60 947-1, EN 60 947-1 (VDE 0660 Part 100), which includes the general specifications for low-voltage switching devices.</li> <li>IEC 60 947-5-1, EN 60 947-5-1 (VDE 0660 Part 100), which includes the general specifications for low-voltage switching devices.</li> <li>IEC 60 947-5-1, EN 60 947-5-1 (VDE 0660 Part 200) which includes, in particular, the requirements for control equipment and switching elements for the control, signaling, locking, etc. of switchgear and controlgear.</li> </ul>
Standards	<ul> <li>The following standards apply to the terminal markings of the contactors:</li> <li>EN 50 012: terminal markings and identification numbers for auxiliary contact elements of particular contactors (also applies to contactors with a built-on auxiliary switch block)</li> <li>EN 50 011: terminal markings, identification numbers, and identification letters for particular auxiliary contactors (also applies to auxiliary contactors with a built-on auxiliary switch block)</li> <li>EN 50 011: terminal markings, identification numbers, and identification letters for particular auxiliary switch block)</li> <li>EN 50 005: terminal markings and identification numbers, general rules</li> </ul>
Approvals/ test reports	Confirmation of approvals and test certificates and characteristics can be obtained on the Internet/intranet.
Shock protection	The shock protection provided is in acc. with DIN VDE 0106 Part 100.

#### 3.1.1 Utilization categories

In acc. with EN 60 947-4-1, the purpose of the contactors and the stress placed on them is indicated by the utilization category together with details of the rated operational current or motor output and the rated voltage.

The following tables list the definitions of the utilization categories for low-voltage switching devices and contactors from IEC 60 947 (VDE 0660) an. The rated operational voltages for the various utilization categories are listed in the low-voltage switching devices catalog.

## Utilization category for AC voltages

AC	Utilization category for AC voltages	Swit OnO	ching capacity I/I <sub>e</sub> ff	Elect OnO <sup>-</sup>	rical service life I/I <sub>e</sub> ff
AC-1	Not an inductive load or a slightly inductive load	1.5	1.5	1	1
AC-2	Slipring motors: switch on, switch off	4	4	2.5	2.5
AC-3	Squirrel-cage motors: switch on, switch off during the run	10	8	6	1
AC-4	Squirrel-cage motors: switch on, plugging or reversing, inching	12	10	6	6

Table 3-1: Utilization categories, test conditions for AC voltage

Definition of AC-1 to<br/>AC-4The definitions of the utilization categories AC-1 to AC-4 for main circuits<br/>can be found in the relevant regulations.

- The main areas of application for contactors are:
- AC-3 operation: switching of squirrel-cage motors
- AC-1 operation: switching of resistive loads
- AC-4 operation: plugging, reversing, inching

**Test conditions** 

Test conditions for the various utilization categories:

- In AC-1 operation, the contactor must be able to switch 1.5 times the rated operational current on and off.
- In AC-3 operation, the starting currents of the motors must be controlled. In other words, the contactor must be able to switch on 10 times the rated operational current ( $I_e$ ), and switch off 8 times the  $I_e$ .
- In AC-4 operation, the contactor must be able to switch off 12 times the rated operational current  $(I_e)$  and 10 times the  $I_e$ . This represents extremely high stress for contactors because the high starting currents of the motors have to be switched off.

The breaking current is decisive in calculating the electrical service life:

- In AC-1 and AC-3 operation, 1 x I<sub>e</sub> must be assumed.
- In AC-4 operation, 6 x l<sub>e</sub> must be assumed because the contactor also has to switch off the motor during startup.

## Utilization category for DC voltages

DC	Utilization category for DC voltages	Switching capacity I/I <sub>e</sub> Make/break	Switching capacity Time constant <sup>L</sup> / <sub>R</sub> (ms)
DC-1	Not an inductive load or a slightly inductive load, resistance furnaces	1.5	1.0
DC-3	Shunt motors: switching on, plugging, reversing, inching	4.0	2.5
DC-5	Series motors: switching on, plugging, reversing, inching	4.0	15
DC-6	Switching of incandescent lamps	1.5	(Incandescent lamp test)

Table 3-2: Utilization categories, test conditions for DC voltages

# Definition of DC-1 to DC-6

The definitions of the utilization categories DC-1 to DC-6 apply to main circuits for switching DC voltage.

The main areas of application for contactors are:

- DC-3/DC-5 operation: switching of shunt or series motors
- DC-1 operation: switching of resistive loads, resistance furnaces

#### Note:

In the information on DC switching capacity in previous documents, the utilization categories DC-2 and DC-4 correspond to the current utilization categories DC-3 and DC-5.

Utilization category for	AC Utilization category for	Switching	capacity
AC voltage (auxiliary contact elements)	AC voltage (auxiliary contact elements)	Make I/I <sub>e</sub>	Break I/I <sub>e</sub> cosφ
	AC-12 Control of resistive load a semiconductor load in the input cuits of optocouplers		1 0.9
	AC-14 Control of a small electro- magnetic load (max. 72 VA)	6	1 0.3
	AC-15 Control of an electromag- netic load (greater than 72 VA)	10	1 0.3

Table 3-3: Utilization categories, test conditions for AC voltage (auxiliary contact elements)

### Definition of AC-12 to AC-15

IEC 60 947-5-1/EN 60 947-5-1 (VDE 0660 Part 200) contains the definitions of the utilization categories AC-12 to AC-15 for switching elements for the control, signaling, locking, etc. of switchgear and controlgear. The main areas of application for auxiliary contactors are:

- AC-14/AC-15 operation: switching of contactor coils, solenoid valves, for example
- AC-14/AC-12 operation: switching of resistive loads, for example

Rated operational cur- rents	The rated operational currents for the various utilization categories are listed in the low-voltage switching devices catalog. The test specifications given in the table for each utilization category represent the scale for the making and breaking capacity of the auxiliary contacts.							
<b>Example</b> 3RT1016 contactor: $I_e/AC-15$ of the auxiliary contact: 6 A/230 V Making capacity: 10 x $I_e/AC-15 = 60$ A								
	<ul> <li>This enables the contactor coil with the greatest power consumption (3TF56) to be switched on.</li> <li>Current value of the contactor coil when switched on: 10.7 A</li> <li>Only the holding current is decisive for switching off the contactor coil: Approximately 0.5 A in the example</li> </ul>							
	According to regulations, the auxiliary contact must normally be able to switch off the rated operational current.							
Utilization category for	DC	Utilization category for DC voltage (auxiliary contact ele- ments)	Switching capacity					
DC voltage (auxiliary contact ele- ments)			Make I/I <sub>e</sub>	Break I/I <sub>e</sub> <sup>L</sup> / <sub>R</sub> (ms)				
	DC-12	Control of resistive load and semiconductor load in the input circuits of optocouplers	1	1 1				
	DC-13	Control of solenoids	1	1 300				
	DC-14	Control of electromagnetic loads with economy resistors in the circuit	10	1 15				
	Table 2.4	Utilization estagarian test condition	a far DC valtaga (avviliagu					
		Utilization categories, test condition	IS TOF DC VOITage (auxiliary	contact elements)				

• DC-13: switching of inductive loads, such as contactor coils and solenoid valves

In DC operation, the difference in stress is also determined by the L/R time constant. This must be specified by the user.

### 3.1.2 Positively driven operation

Regulations	<ul> <li>For contactors</li> <li>For auxiliary co</li> <li>ZH 1/457</li> <li>SUVA</li> <li>SIRIUS contacto</li> <li>The core message</li> </ul>	sicherungsanstalt (Swiss in rs comply with these regulat ge of these regulations is:	l (draft 17B/996/DC) nendment 2, Annex L, on power-operated presses nes of the Schweizer Unfallver- stitute for accident insurance)

	Positively driven	optimized auxiliary switch blo operation is not compulsory tive for protective circuits.	
3.1.3 Safe isolation			
	low voltage (SEL tion reliably prev transferring to th that is applied to Safe isolation is a	V/PELV) and functional extra ents voltage that is capable e safely isolated voltage (e.g or switched to the same de	nportant due to the more wide-
Definition	voltage from one example, a bent	e circuit to another. Faults to or loose conductive part, a b	does not result in a transfer of be taken into account are, for ent soldering pin, broken win- oken partition wall in a device.

Regulations IEC 61 140 (replacing VDE 0106 Part 101/IEC 536) lists basic requirements that can be met using safe isolation between circuits in electrical equipment. Basic requirements are, for example: Double or reinforced insulation • Protective screening Combination of double or reinforced insulation and protective screening The insulation must be resistant to aging throughout the expected service life. Circuits without protective extra-low voltage or functional extra-low voltage do not require safe isolation. Safe isolation in the If the conducting paths of a contactor are operated with different voltages, the requirements for safe isolation must be met. case of 3RT1 and 3RH1 contactors In the case of the 3RT1 and 3RH1 contactors, safe isolation is ensured up to the following voltage:

- Safe isolation between the different main conducting paths is always 400 V.
- Safe isolation between the different main conducting paths and the coil connection is always 400 V.
- The following table lists the values for safe isolation between the main and auxiliary conducting paths and the coil connection:

	3RT1 and 3RH1 contactors						
	Frame size S00 Main con- tact	Frame size S0 Main contact	Frame size S2 Main contact	Frame size S3 Main contact			
Aux. switch at front at side Coil connection	690 (*) - 400	500 690 400	500 500 400	500 690 400			

Table 3-5: Safe isolation

(\*) Only applies to 4-pole auxiliary switch blocks at the front

All the data are power system specifications with 10% overvoltage in volts  $\left[V\right].$ 

400 V + 10% corresponds to 415 V + 5% and 500 V + 10% corresponds to 525 V + 5%.

#### Attention

In the table, the voltage that can cause electric shock and that must be safely isolated is critical. If the voltages 400 V and 24 V are to be safely isolated from one another, contactors with safe isolation up to 400 V must be used between the two points of connection used.

### 3.1.4 Explanation of terms

Safety extra-low volt- age	Safety extra-low voltage (SELV) allows circuits with a rated voltage of up to 50 VAC or 120 VDC to be operated ungrounded. The higher voltage is safely isolated from the SELV circuits. Safety extra-low voltage helps protect people.
Functional extra-low voltage	Functional extra-low voltage (FELV) allows circuits with a rated voltage of up to 50 VAC or 120 VDC can be operated. It does not, however, meet the requirements of safety extra-low voltage and is therefore subject to additio- nal conditions. FELV is implemented using a ground terminal. Functional extra-low voltage helps protect devices (e.g. programmable con- trollers).
PELV	PELV (protective extra-low voltage) has the same requirements as safety extra-low voltage, except for the fact that the circuit and/or exposed conductive part is/are grounded (so it is basically grounded SELV).

### 3.2 Device description

The SIRIUS contactors are components of the SIRIUS modular system and can therefore offer the typical benefits of SIRIUS when it comes to the selection of components and the assembly and operation of controllers and load feeders.

The SIRIUS range of contactors encompasses the following:

- Contactors for switching motors of up to 45 kW/400 V
- Auxiliary contactors with the contact variants 4 NO, 3 NO +1 NC, and 2 NO + 2 NC
- Contactor relays for system-specific cooperation with electronic controllers
- Contactors for particular applications:
  - Contactors with 4 main contacts
  - Capacitor switching contactors
  - Contactors for switching resistive loads
  - Contactors with an extended operating range
  - Contactor combinations

#### Frame sizes

The SIRIUS range of contactors covers everything up to 45 kW in 4 frame sizes. Each frame size has 3 or 4 standard motor outputs:

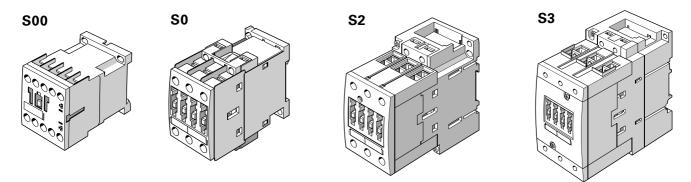

Figure 3-1: Frame sizes of the 3RT1 contactors

#### Performance ranges

The following table specifies the performance ranges for the frame sizes of the 3RT10 contactors:

Frame size	S00		SO			S2			S3				
Order number		3RT10		0 3RT10		3RT10		3RT10					
	15	16	17	23	24	25	26	34	35	36	44	45	46
At 400 V:													
P/AC-3kW	3	4	5.5	4	5.5	7.5	11	15	18.5	22	30	37	45
I <sub>e</sub> /AC-3 A	7	9	12	9	12	17	25	32	40	50	65	80	95
Width		45 mm			45	mm			55 mm			70 mm	<u> </u>

Table 3-6: Performance ranges of the 3RT10 contactors

The following table provides an o	overview of the existing variants	of the 3RT and 3RH contactors:
-----------------------------------	-----------------------------------	--------------------------------

Models		Frame size
3RT10 contactors	AC/DC operation To operate motors, 3-pole, up to 45 kW/400 V I <sub>e</sub> /AC-1 up to 40 °C: up to 120 A to 690 V I <sub>e</sub> /AC-3 up to 60 °C: up to 95 A/400 V	S00 to S3
3RT14 contactors	AC/DC operation To switch resistive loads, 3-pole, up to 92 kW/400 V I <sub>e</sub> /AC-1 at 40 °C: up to 140 A to 690 V	S3
3RT13 contactors	AC/DC operation, 4 main contacts (NO contacts) To switch resistive loads, up to 92 kW/400 V I <sub>e</sub> /AC-1 up to 40 °C: up to 140 A to 690 V	S00 to S3
3RT15 contactors	AC/DC operation, 4 main contacts (2 NO contacts + 2 NC contacts) To switch three-phase induction motors up to 18.5 kW/400 V $\rm I_e/AC$ -3 up to 60 °C: up to 40 A to 400 V	S00 to S2
3RT16 contactors	AC operation To switch three-phase capacitors up to 50 kvar/400 V	S0 to S3
3RH/3RT contactors	DC operation with an extended operating range: 0.7 to 1.25 x U <sub>S</sub> 3RT: to switch motors up to 45 kW/400 V $I_e$ /AC-3 up to °C: 95 A to 400 V 3RH: to switch auxiliary circuits $I_e$ /AC-15/AC-14 up to 70 °C: 6 A/230 V	S00 to S3
3RT contactor relays (interface)	DC operation with an extended operating range: 0.7 to 1.25 x $\rm U_S$ To switch motors, 3-pole, up to 11 kW/400 V $\rm I_e/\rm AC-3$ up to 60 °C: 25 A to 400 V	S00 and S0
3RA13 contactor combina- tions	AC/DC operation To reverse up to 45 kW/400 V, I <sub>e</sub> /AC-3: 95 A/400 V	S00 to S3
3RA14 contactor combina- tions	AC/DC operation, for star-delta startup up to 75 kW/400 V, I <sub>e</sub> /AC-3: 150 A/400 V	S00-S00-S00 to S3-S3-S2
3RH11 auxiliary contactors	AC/DC operation, to switch auxiliary circuits, 4-pole (basic unit) I <sub>e</sub> /AC-15/AC-14 up to 60 °C: 6 A/230 V	S00
3RH14 latched auxiliary contactors	AC/DC operation, to switch auxiliary circuits, 4-pole (basic unit) I <sub>e</sub> /AC-15/AC-14 up to 60 °C: 6 A/230 V	S00
3RH11 contactor relays (interface)	DC operation with an extended operating range (0.7 to 1.25 x $\rm U_{S)}$ to switch auxiliary circuits, 4-pole $\rm I_e/\rm AC-15/\rm AC-14$ up to 60 °C: 6 A/230 V	S00
Unwelded contactors 3RT11 24, 3RT11 35	<ul> <li>The unwelded contactors are put together using a circuit breaker to make an unwelded feeder. The features are:</li> <li>Standard: IEC 947-6-2 (for feeders with increased requirements)</li> <li>Compact</li> <li>Extremely high reliability in the entire current range up to 50 kA</li> </ul>	S0, S2

Table 3-7: Types of 3RT/3RH contactors

### Auxiliary contacts and built-on accessories

- A uniform and diverse range of auxiliary switches and accessories that can be quickly upgraded and replaced is available for 3RT1 contactors up to 45 kW for various applications.
- The 3RH auxiliary contactors can be extended to form variants with a maximum of 8 poles using attachable 2 or 4-pole auxiliary switch blocks.
- Wiring kits with and without mechanical interlocking are available for putting together 3RA contactor combinations for reversing and for star-delta starting.

The accessories are described in detail in Section 3.4, "Accessories".

#### 3.2.1 Actuating systems

AC coil:	<ul> <li>Ferromagnetic iron core (due to eddy current losses)</li> <li>Adequate holding power</li> <li>Automatic reduction from high closing power to low holding power</li> <li>Short switching times</li> </ul>
DC coil:	<ul> <li>Solid parts are permissible</li> <li>Larger unit volumes (to achieve a tensile force comparable to that of an AC coil)</li> <li>High holding power</li> <li>Closing power = holding power</li> <li>Longer switching times</li> </ul>

Table 3-8: Actuating systems

#### 3.2.2 Short-circuit protection of the SIRIUS contactors

Section 3.7, "Technical specifications", has information on short-circuit protection. Fuses and circuit breakers can be used as short-circuit protective devices for the contactors. The test criteria that apply in this case are stipulated by EN 60 947-4-1 (VDE 0660 Part 102).

Coordination typesTwo types of assignment are defined in the standards that correspond to<br/>two different levels of damage.<br/>The following applies to both types of assignment:<br/>In the event of a short-circuit, the short-circuit protective device used must<br/>be able to disconnect the overcurrent that occurs both safely and success-<br/>fully. Persons or other parts of the system must not be put at risk.

**Coordination type 1** The load feeder (e.g. motor starter) can be inoperable after each short-circuit disconnection. Damage to the contactor and the overload relay is permissible, but it is only possible to continue operation after defective devices have been repaired or replaced.

Coordination type 2	After short-circuit disconnections, there must be no damage to the load feeder devices. The only exception is if the contactor contacts have been welded and can be easily separated again without distorting the contact pieces.
Contactors with over- load relay	If contactors are combined with an overload relay, a smaller fuse as speci- fied in the NSK catalog on permissible short-circuit protection fuses for motor starters should be used.
	The information required to ensure unwelded fusing of the contactors is contained in the NSK catalog.

#### 3.2.3 Operation

#### 3.2.3.1 General information

# Ambient temperature The 3RT10 contactors are designed for use in ambient temperatures of -25 °C to +60 °C. Some variants can be used in temperatures of -35 °C to +70 °C.

**Degree of protection** The degree of protection of the SIRIUS contactors is IP20.

#### Warning

When the supply voltage and load are present, the contactor must not be actuated by pressing the contact support. It is permissible, however, to carry out tests with an extra-low test voltage (e.g.  $\leq$  24 V).

#### **Mechanical life**

A significant criterion for the economical use of contactors is their mechanical endurance. This is expressed in the number of operations that are possible without placing a load on the conducting path. You cannot expect too much in terms of mechanical endurance from switches that have to work with a relatively high contact load, such as isolators and circuit breakers without neglecting their cost-efficiency. Contactors, on the other hand, are switching devices designed specifically for very high numbers of operations and switching frequency.

The following table shows you the mechanical endurance of 3RT1 contactors:

Device	Mechanical endurance
Basic unit, frame size S00	30 mill. operating cycles
Basic unit, frame size S00 with built- on auxiliary switch block	10 mill. operating cycles
Basic unit, frame sizes S0 to S3	10 mill. operating cycles
Basic units, frame sizes S00 to S3 with built-on, electronically optimized auxiliary switch block	5 mill. operating cycles

Table 3-9: Mechanical endurance

The mechanical endurance can be increased if low current is used (for example, 17 V 5 mA) but only if there is no arcing during switching.

#### **Display of the contactor function** The 3RT1926 LED indicator block can be connected to the coil connections of the contactors in frame sizes S00 to S3. It indicates the status of the contactors by means of the yellow LED. The indicator block can be snapped onto the front in the opening intended for the inscription plate. The advantage is that the LED indicator block can be used for AC/DC voltages of 24 V to 240 V and that it is protected against polarity reversal.

#### 3.2.3.2 Contact reliability

Increasingly in industrial control engineering, conventional contactor controls are combined with electronic control systems. Working together in this way gives rise to higher demands than those when used in conventional contactor controls.

An important requirement is that the signal generators (auxiliary contacts of contactors, for example) display high contact reliability at low voltages and currents, while retaining their full switching capacity at high voltages.

# Switching with auxiliary contacts ( $\leq$ 110 V and $\leq$ 100 mA)

The following applies to the contactors of the SIRIUS range:

If voltages  $\leq$  110 V and currents  $\leq$  100 mA are to be switched, the auxiliary contacts of the 3RT1 contactors or the 3RH1 auxiliary contactors should be used instead of the main contacts because of their contact reliability. This comes from their high contact stability due, in particular, to the shape of the contact pieces (cross-ribbing).

This ensures that the points of contact remain conductive in spite of surface contamination and the effect of dust.

These auxiliary contacts are suitable for electronic circuits (programmable controllers) with voltages > 17 V and currents in the milliampere range (test circuit: 17 V, 5 mA).

**Cross-ribbing** Surface contamination is the most common cause of contact faults. Crossribbing the contact areas is an extremely effective way of increasing contact reliability. All the auxiliary contacts of the SIRIUS contactors have this feature.

The following illustration show you how cross-ribbing is particularly effective against surface contamination due to the high number of contact areas and high surface pressure:

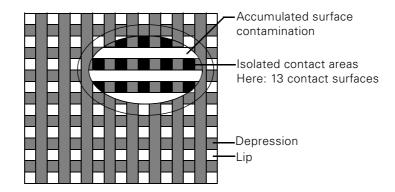

Figure 3-2: Contact areas

## Contact reliability of the auxiliary contacts

The contact areas of the SIRIUS auxiliary contacts display a high degree of contact reliability. Fault frequency rates of  $H_F \le 10^{-8}$  (i. e. < 1 fault per 100 mill. operating cycles at 17 V, 1 mA) have been registered. These values apply to auxiliary contacts that are either integrated in the contactor housing or can be snapped on as auxiliary switch blocks. In the case of built-on auxiliary switch blocks at the side, fault frequency

rates are between  $10^{-6}$  and  $10^{-8}$ .

The tests are based on the requirements placed on signal generators by electronic controllers.

This means that with the auxiliary contacts of the SIRIUS contactors or auxiliary contactors, the permissible contact resistance is only exceeded once during a total of  $10^8$  (100 million) switching operations. During a long period of operation, therefore, a fault is not expected to occur, irrespective of the number of switching operations.

A restriction applies in the case of auxiliary switch blocks built on at the side.

### Definition of switch fault frequency H<sub>F</sub>

The fault frequency  $H_F$  is defined as the number of contact faults that occur during a certain number of switching operations.

# Electrical service life of the main contacts

The rated operational current  $I_e$  is defined in acc. with utilization category AC-4 (switching off 6 times the rated operational current) for a contact service life of approximately 200 000 operating cycles.

If mixed modes are used - in other words, if normal switching mode (the rated operational current is switched off in acc. with utilization category AC-3) is mixed with occasional inching mode (several times the rated operational current is switched in acc. with utilization category AC-4) - the service life of the contact pieces can be roughly calculated with the following formula:

$$X = \frac{A}{1 + \frac{C}{100} \cdot \left(\frac{A}{B} - 1\right)}$$

Key to the formula:

- X Contact service life in mixed mode in operating cycles
- A Contact service life in normal operation  $(I_a = I_e)$  in operating cycles
- B Contact service life in inching mode  $(I_a = a \text{ multiple of } I_e)$  in operating cycles
- C Percentage of the total number of switching operations accounted for by inching operations

The following characteristic curves illustrate the contact service life of contactors when switching inductive three-phase loads (AC-3), irrespective of the breaking current and rated operational voltage. The prerequisites are arbitrary (i.e. not synchronous with the phase relation of the control station operating the network).

#### Characteristic curve: contact service life of the main contacts

The characteristic curves illustrate the contact service life of the main contacts of contactors when switching inductive three-phase loads (AC-3).

l<sub>a</sub> = breaking current

Ie = rated operational current

 $\mathsf{P}_{\mathsf{N}}$  = rated output of three-phase induction motors with squirrel cage at 400 V

#### Frame size S00

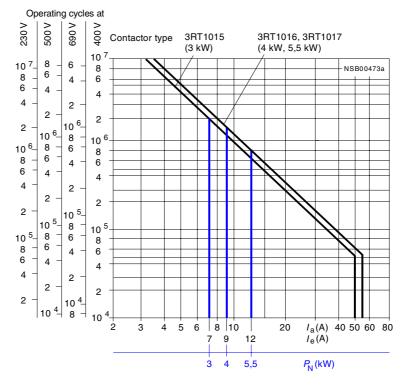

Figure 3-3: Characteristic curve of the electrical service life of the main contacts (frame size S00)

#### Frame size S0

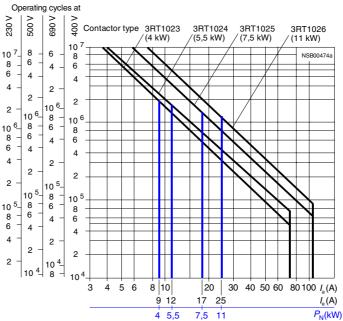

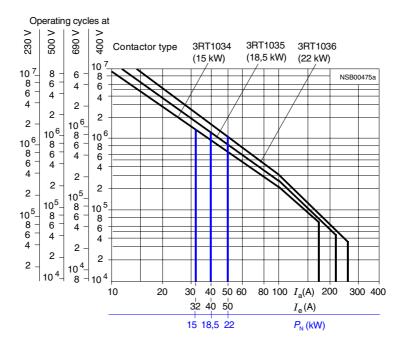

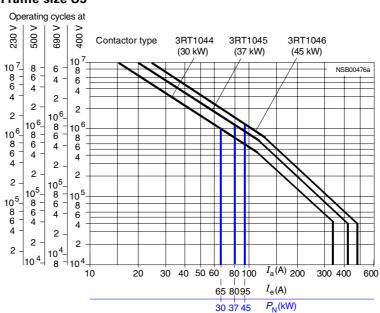

Figure 3-4: Characteristic curve of the electrical service life of the main contacts (frame size S0)

#### Frame size S2

#### Frame size S3

#### Characteristic curve: contact service life of the auxiliary contacts

The contact service life depends on the breaking current. The prerequisites are arbitrary (i.e. not synchronous with the phase relation of the control station operating the network).

The characteristic curves apply to:

- Integrated 3RT10 auxiliary contacts
- 3RH1911 auxiliary switch blocks for contactors in frame size S00
- 3RH1921 auxiliary switch blocks for contactors in frame sizes S0 to S3

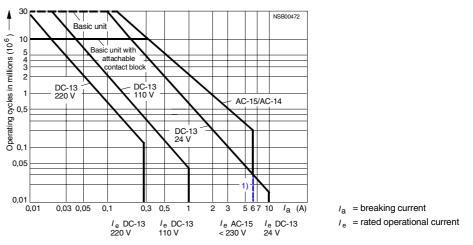

Figure 3-7: Characteristic curve of the electrical service life of the auxiliary contacts

### 3.3 Application and areas of use

Various switching devices are available for switching electrical loads. The contactor is most suitable device for frequent switching operations. Contactors are the most commonly used switching device in industry, mechanical engineering and in switchgear and controlgear. Due to the increased automation of production, contactors have become more important, involving greater and often different types of demands.

Automated production systems are considerably more sensitive to operational malfunctions than manually operated systems. Each fault on an electrical device means downtimes, wastage, loss of production and often considerable outlay in order to get the system up and running again. For this reason, we concentrated on high reliability when developing the SIRIUS contactor range. This includes, in particular, increased service life, high contact reliability, and the possibility to use the contactors at higher ambient temperatures in the cubicle. It is possible to use the contactors up to 60 °C and also without derating when the devices are installed in a row.

To deal with the variety of possible applications, there are also contactor variants for special applications, such as for switching resistive loads or capacitors, in addition to the main 3RT10 range of contactors (for switching motors).

The different contactor ranges and their possible applications are described in the following subsections.

#### 3.3.1 3RT10 contactors with 3 main contacts for switching motors

Field of application	The 3-pole 3RT10 contactors use 3 NO contacts as main contacts. They are mainly used to switch three-phase induction motors.
Frame sizes	<ul> <li>The full performance range from 3 to 45 kW/400 V (utilization categories AC-2 and AC-3) is covered by 4 frame sizes.</li> <li>The frame sizes cover the following levels of standard motor output:</li> <li>Frame sizes S00, S2, S3: three standard levels of motor output each</li> <li>Frame size S0: 4 standard levels of motor output</li> </ul>
Dimensions	The contactors are provided with alternating or direct current magnetic sys- tems. The required floor areas of the devices of the two operating mecha- nism types are the same. As of frame size S0, the installation depth for con- tactors with the DC magnet system is between 10 mm and 15 mm greater than for the variants with the AC magnet system.
Power ratings	All the specified power and current ratings apply to an ambient temperature of 60 °C without derating.

Increasing the power	The ease of expansion is an advantage for configuration. In many applica-
	tions there is enough space to insert the contactor with the next higher rat-
	ing class and thus increase motor output.

#### 3.3.2 3RT1446 contactors with 3 main contacts for switching resistive loads (AC-1)

**Field of application** The 3RT14 46 contactors with 3 main contacts for switching resistive loads are used for applications in the AC-1 utilization category:

- Switching of resistive loads such as heating systems or resistance furnaces
- Applications in which a low switching capacity is sufficient
- Applications in which high continuous currents occur without peaks (e.g. as a generator contactor or in the case of variable-speed drives.

**Switching capacity** 1.5 times the  $I_e/AC-1$  can be switched on and off. Switching off higher currents, with the emergency stop, for example, is possible up to 8 times the  $I_e/AC-3$  current.

Comparison: 3RT1046/The following table shows you the difference between the 3RT1446 and<br/>3RT1046 contactors for normal AC-3 applications:

	Contact material	Conducting paths
3RT1446	Contact material with high current-carrying capacity and better thermal properties	Larger conducting paths that permit better cooling
3RT1046	Contact material that ensures better switching capacity	

Table 3-10: Comparison between the 3RT1446 and 3RT1046 contactors

**Note on configuration** The 3RT10 range of contactors for switching motors also has a specific AC-1 switching capacity. It is much less costly, however, to use the AC-1 contactor 3RT14 for this specific purpose.

Accessories You can use the same accessories for the 3RT14 contactors as you can for the 3RT104 contactors in frame size S3.

#### 3.3.3 3RT13 and 3RT15 contactors with 4 main contacts

Model

There are two variants of the contactors with 4 main contacts :

- 3RT13 with 4 NO contacts
- 3RT15 with 2 NO and 2 NC contacts

You can use the accessories for both the 3-pole SIRIUS contactors and the 4-pole variants.

**Field of application** The following table gives the fields of application for the 3RT13 and 3RT15 contactors:

3RT13 contactors with 4 NO contacts	3RT15 contactors with 2 NO + 2 NC contacts
<ul> <li>Switching of resistive loads</li> <li>Isolation of networks with ungrounded or badly grounded neutral conductors</li> <li>Supply switchovers in the case of alternative AC power supplies</li> <li>As a contactor - for example, in variable-speed drives that only have to carry the current, not switch it</li> </ul>	<ul> <li>Pole switchover in the case of crane-type motors</li> <li>Switching of 2 separate loads</li> </ul>

Table 3-11: Applications of 4-pole contactors

#### **Auxiliary contacts**

The following table specifies the maximum number of auxiliary contacts that can be attached:

Frame size S00	Frame size S0	Frame sizes S2 and S3
4 auxiliary contacts	Maximum 2 auxiliary con- tacts (built on at the side or snapped on at the top)	Maximum of 4 auxiliary contacts (built on at the side or snapped on at the top)

Table 3-12: 4-pole contactors and auxiliary contacts

Contactor combinationThe 4-perspectivewith mechanical inter-sizes SClockingmechanical

The 4-pole 3RT13 contactors with 4 NO contacts as main contacts in frame sizes S0 to S3 are suitable for putting together contactor combinations with mechanical locking for use, for example, in supply switchovers. The following tables show how the contactor combinations are put together in different frame sizes:

Assembly of the contactors in frame size S0 with front interlocking

Drawing: frame size S0	Step	Procedure
	1/2	Remove the fourth pole of the left contactor by pressing the ribbed surfaces at the top and bottom at the same time (1) and then removing the pole (2).
clic 4 clic 4 clic 4 clic 4 clic 4 clic 4 clic 4 clic clic	3/4	Attach the pole to the left side of the same contactor.
S Clic S	5/6	Put the contactors together by inserting two mechanical cou- plers (3RA1922-2C) in the appropriate openings of the contactor <b>(5)</b> , and then press the other contactor onto these mechanical couplers <b>(6)</b> .
R R R R R R R R R R R R R R R R R R R	7/8/9	Mount the mechanical inter- lock at the front (3RA1924-1A) over the two contactors.

Drawing: frame sizes S2 and S3	Step	Procedure
3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3 3	1/2	Mount the mechanical inter- lock between the two contac- tors <b>(1/2)</b> , and insert the 2 connecting clips (10 mm spa- cing) <b>(3)</b> on the back of the two contactors.

Table 3-15: 4-pole reversing contactor combination (frame sizes S2 and S3)

#### Attention

The mechanical interlock at the front cannot be used in contactors in frame sizes S2 and S3.

#### 3.3.4 3RT16 capacitor-switching contactors for switching capacitors

**Field of application** 3RT16 capacitor-switching contactors are used to switch power capacitors that are used in reactive-current compensation.

**Frame sizes** 

The capacitor-switching contactors are available in frame sizes S00 to S3 with the rating levels 12.5, 15 kvar, 25 kvar, and 50 kvar at 400 V.

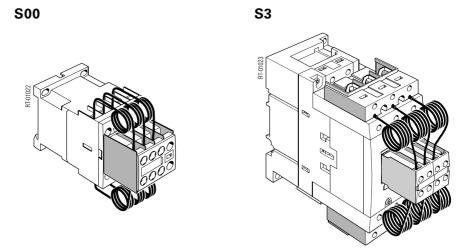

Figure 3-8: Capacitor-switching contactors (frame sizes S0 and S2)

Auxiliary switch The auxiliary switch block snapped onto the capacitor-switching contactor contains three leading NO contacts and a normal NO contact that can be assigned as you wish. A 2-pole auxiliary switch block can also be attached at the side of the capacitor-switching contactors (variants: 2 NO contacts, 2 NC contacts, or 1 NO + 1 NC contact).

Switching capacitors/ banks of capacitors A single capacitor can normally be switched on because the current is limited by the inductance of the upstream transformer and the cables. It is more difficult to switch banks of capacitors (parallel connection of a capacitor to capacitors already present) because the current is now only limited by the low inductance of the connecting leads and the capacitors. This problem is solved in the case of capacitor-switching contactors using precharging resistors.

**Precharging resistors** The precharging resistors are an integral part of the contactor in 3RT16 capacitor-switching contactors. They are switched on via leading auxiliary contacts before the main contacts close. This results in damping down to approximately 10 % of the undamped peak currents. Damping of peaks in the making current prevents disturbances to the network.

#### Important

Make sure when switching banks of capacitors that you adhere to the specified minimum inductance between the capacitors connected in parallel that are to be provided in addition.

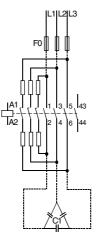

**3RT10. capacitor switching capacity** The normal 3RT10 contactors for switching motors also have a certain capacitor switching capacity. Details of this can be found in Section 3.7, Technical specifications: Utilization category AC-6b, switching of individual capacitors and switching of low-inductance three-phase capacitors. The tables contain information on the switching of individual capacitors and the switching of banks of capacitors.

Operation

#### Caution

Only switch to discharged capacitors! Do not carry out a function test by hand. The precharging resistors must not be removed as this will damage the con-

Circuit diagram

tact pieces in circuits with a load.

Figure 3-9: Capacitor-switching contactors, circuit diagram

#### 3.3.5 Contactors with an extended operating range

**Field of application** The contactors with an extended operating range are used in systems with strong fluctuations in the control supply voltage and at the same time high ambient temperatures, such as railway applications in extreme climatic conditions, rolling mills, etc.

Contactors with an extended operating range comply with the following standards:

- IEC 60 947-4-1
- EN 60 947-4-1 (VDE 0660 Part 102)
- The requirements of IEC 60 077

They are shockproof in acc. with DIN VDE 0106 Part 100. Exception: the series resistor in frame sizes S0 to S3

Standards

Control current circuits and auxiliary current circuits	The magnet coils of the contactors have an extended operating range of 0.7 to $1.25 \times U_s$ and are wired with varistors as standard to provide protection against overvoltage. This increases the time to contact parting compared with standard contactors by 2 ms to 5 ms.
With/without a series resistor	The 3RH11 and 3RT10 contactors with the suffix -0LA0 at digits 13 to 16 in the order number are used particularly where, in addition to a wide operat- ing range and a high ambient temperature of 70 °C, several auxiliary con- tacts are required. Up to 4 auxiliary contacts can be used in these variants. To ensure that the magnetic system can produce the required amount of power at power-up, the contactors initially require a certain amount of over- excitation. By means of the series resistor, the contactors are switched to the normal hold-in coil level after power-up. If fewer auxiliary contacts are required, contactors with the same extended operating range that work without a series resistor are available up to frame size S0. The two ranges are described in more detail below.

### 3.3.5.1 Contactors with an extended operating range (3RH11...-0LA0/3RT10...-0LA0)

	The DC magnetic systems of the contactors must be switched to hold-in coil level via a series resistor.
Arrangement of compo- nents in frame size S00	<ul> <li>Auxiliary contactors and contactors of frame size S00 are available with the following:</li> <li>A built-on block that contains the series resistor (the NC contact required for the switchover in the basic unit is already wired).</li> <li>Integrated varistor</li> <li>A 4-pole auxiliary switch block (in acc. with EN 50 005) can also be built on.</li> </ul>
Arrangement of compo- nents in frame sizes S0 to S3	Contactors of frame sizes S0 to S3 are fitted on the front with an auxiliary switch block with 2 NO contacts + 2 NC contacts. The separate series resistor that is attached at the side next to the contactor on the 35 mm rail has connecting leads for contactor attachment. An NC contact of the auxiliary switch block is required for the switchover to hold-in coil level. A circuit diagram with the terminal points is stuck onto each contactor.
Auxiliary contacts	One NC contact of the auxiliary contacts is required for the series resistor. The number of auxiliary contacts that are available beyond this is listed in the selection and order data. With frame size S00, the auxiliary switch block that you may need must be ordered separately.

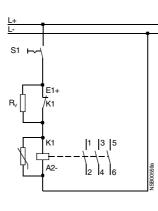

**Circuit diagrams** 

Installation	The following types of installation are permissible for contactors and auxil- iary contactors in ambient temperatures of up to 70 °C: Frame size S00: installation in series Frame sizes S0 to S3: The resistor block must be installed on the right next
	to the contactor because of the connecting leads there.

**Dimensions** When the resistor is mounted, the contactors of frame sizes S0 to S3 become wider (see Section 3.6, Dimensioned drawings).

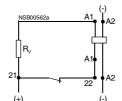

Figure 3-12: Contactors with an extended operating range, circuit diagram

## 3.3.5.2 Contactors with an extended operating range (3RH1122-2K.40, 3RT1017-2K.4., 3RT102.-3K.40)

Contactors of frame size S00: 3RH11 22-2K.40, 3RT1017-2K.4. and frame size S0: 3RT102.-3K.40 have the following features: • Extended operating range of 0.7 to 1.25 x U<sub>s</sub> • The magnet coils are wired with a varistor; an additional series resistor is not required • Permissible ambient temperature 60 °C Note the following: • Frame size S00: an auxiliary switch block cannot be attached • Frame size S0: a maximum of two 1-pole auxiliary switch blocks can be attached At an ambient temperature > 60 °C  $\leq$  70 °C, there must be spacing of Installation 10 mm when installing in series. The permissible ambient temperature for operating the contactors at the full Ambient temperature operating range of the magnet coils is -35 °C to +70 °C. During continuous operation with temperatures > +55 °C, the mechanical service life, the current-carrying capacity of the conducting paths, and the switching frequency are reduced. 3.3.6 3RH1 auxiliary contactors

> Auxiliary contactors are switching devices for auxiliary circuits for controlling, reporting, and interlocking. Auxiliary contactors have to meet specific requirements in terms of clear terminal markings and a time- and cost-saving terminal system.

The SIRIUS 3RH1 auxiliary contactors (frame size S00) meet these requirements

**Terminal markings** The terminal markings comply with EN 50 011 and EN 50 005 (for a more detailed explanation, see Section 3.4.1, Auxiliary switches).

**Frame size and features** 3RH1 auxiliary contactors are available with the following:

- Frame size S00
- With AC and DC operation
- Format as for motor contactor of frame size S00
- 4-pole basic version
- Can be extended to 8 poles with snap-on auxiliary switch blocks
- Screw-type or Cage Clamp terminals

# **Screw-type terminals** The 3RH1 auxiliary contactors have captive screws (cross-tip Pozidriv, size 2), with all the terminal points open on delivery. The screwdriver guides allow screwdriving machines to be used.

Cage Clamp terminals	The 3RH11 auxiliary contactors are also available with Cage Clamp terminals - a screwless terminal system. This type of terminal is particularly suitable if strong shaking or vibrations can be expected at the installation location. These terminals are also suitable for two-conductor connections. All the ter- minals are accessible from the front and are easily visible.
Soldering pin connections	Both the 4-pole basic version as well as the auxiliary contactors that have an auxiliary switch block attached at the front (see Section 3.4, Accessories) can be soldered onto printed circuit boards using a soldering pin adapter.
Contact reliability	All the switching elements of the 3RH1 auxiliary contactors are equipped with contact pieces that have particularly high contact stability, ensuring high contact reliability even at low voltages and currents. This subject is discussed in detail in Section 3.2.3.2, "Contact reliability".
3RH14 latched auxiliary contactors	If there is a short circuit in the low-voltage network, or when large drive motors are switched on directly, the control supply voltage for the auxiliary contactors may fail briefly or fall under the permissible tolerance level. To ensure continuous operation, the variant with mechanical latching (3RH14) can be used with the auxiliary contactors. These auxiliary contactors latch mechanically after power-up and remain in an energized state even in the event of a power failure. The auxiliary contac- tor can be unlocked electrically using an interlock release magnet or manu- ally using a button on the front of the attached latched block. When the volt- age returns, the production program can be resumed immediately without resetting times due to the storage feature of the auxiliary contactors. The contactor coil and the coil of the release magnet are both designed for con- tinuous operation. The power input is the same for the contactor coil and the release coil. The mechanical service life is 1 million operating cycles.

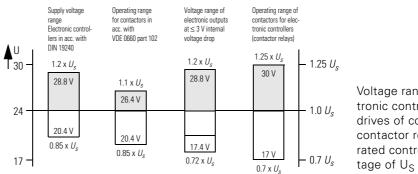

## 3.3.7 3RT10 contactor relays for switching motors (interface) and 3RH11 contactor relays for switching auxiliary circuits

Contactor relays are available in the SIRIUS modular system for switching motors and auxiliary circuits for the purpose of smooth interaction with electronic controllers. These are variants of the 3RT10/3RH11 contactor series with the following features:

- Low power input
- Wide operating range of the magnet coil 0.7 to 1.25 x  $\rm U_{S}$
- High contact reliability of the auxiliary contacts
- Integrated or attachable overvoltage damping

Contact reliability	The high contact reliability of the auxiliary contacts ensures that false sig- nals do not occur even at low switching capacities. With a voltage of 17 V and a current of 1 mA, there is on average less than one contact fault per 100 million switching operations.
Overvoltage damping	Overvoltage damping protects sensitive output levels of electronic control- lers against switching overvoltages of the coil.
Extended operating range	The operating range of the coil of the contactor relays covers a voltage range from 0.7 to 1.25 x U <sub>s</sub> (U <sub>s</sub> = rated control supply voltage). This wide operating range is required for the supply voltage of electronic controllers with the required voltage tolerances. The supply voltage of electronic controllers with 24 VDC covers the range 20.4 V to 28.8 V in acc. with DIN 19 240. If you take into consideration an additional loss of voltage of up to 3 V during the output phases, the contactor drive must be able to operate perfectly with voltages between 17.4 V and 28.8 V. The 3RT10 and 3RH11 contactor relays for electronic controllers operate safely from 17 V to 30 V, which corresponds to a voltage range of 0.7 x U <sub>s</sub> to 1.25 x Us. This is a considerably wider operating range than that of 0.85 to 1.1 x U <sub>s</sub> for contactors and auxiliary contactors in acc. with IEC 60 947, DIN EN 60 947 (VDE 0660).

#### **Voltage ranges** The following graphic shows you the voltage ranges for electronic controllers and drives of contactors and contactor relays with a rated control supply voltage of $U_s = 24$ VDC:

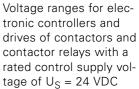

Figure 3-13: Contactor relays: voltage ranges

Auxiliary switch blocks	Auxiliary switch blocks can be built on as follows: Frame size S00: none Frame size S0: a maximum of two 1-pole auxiliary switch blocks
Power consumption	<b>Variant 1:</b> The power input of the magnet coils for contactor relays in frame size S00 is 2.3 W at 24 VDC (operating range: 0.7 to 1.25 x $U_S$ ).
	<b>Variant 2:</b> Contactor relays with reduced coil performance in frame size S00, $P = 1.4$ W at 24 VDC (operating range: 0.85 to 1.85 U <sub>S</sub> ).
	The power input of magnet coils for contactor relays in frame size S0 is 4.2 W at 24 VDC (operating range: 0.7 to 1.25 x U <sub>S</sub> ).

#### 3.3.8 Contactor combinations for reversing

Contactor combinations are available for reversing (3RA1) in frame sizes S00 to S3:

- Installed in the factory
  - Frame sizes S2 and S3 are delivered already mounted on a base plate.
- As a kit for self-assembly

The same accessories can be used as for the basic units of the corresponding frame size (see Section 3.4).

For motor protection an overload relay must be attached.

4-pole contactor combinations for reversing can be put together in frame sizes S0 and S2.

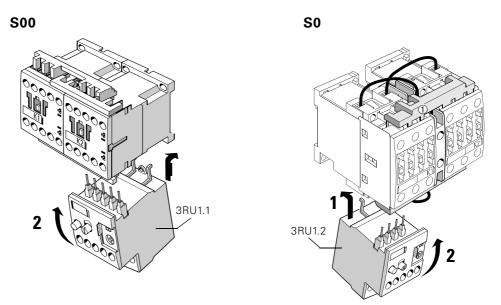

Figure 3-14: Fully assembled contactor combination for reversing (frame sizes S00 and S0)

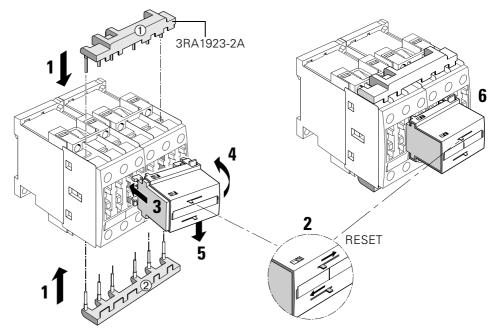

Approvals	The <b>®</b> and <b>®</b> approvals only apply to complete contactor combinations and not to combinations you have assembled from separate parts.
Switchover time	If the contactors are interlocked by means of their auxiliary switches (electri- cal interlocking) or by mechanical interlocking, there is no overlapping of the contacting and the arcing time between the contactors at switchover. The switching times of the contactors are not affected by the mechanical interlock.
	Note for frame size S00:

At voltages of >500 V a switchover pause of 50 ms must be included. AC-operated 3RT10 contactors in reversing or Dahlander mode require an NC contact interlock and a switchover pause of 50 ms.

Auxiliary contact elements	Different auxiliary switches can be attached (at the front or the side) to the 3RA1 reversing combination. An integrated auxiliary switch contact is available in frame size S00.
Accessories	<ul> <li>The following accessories for the basic units can also be used for contactor combinations for reversing:</li> <li>Auxiliary switch blocks (at the front/side)</li> <li>Surge suppressors</li> <li>Soldering pin adapters (frame size S00)</li> <li>The following accessory is designed specifically for contactor combinations for reversing:</li> <li>Locking devices for mechanical interlocking</li> <li>Locking devices for mechanical and electrical interlocking (at the front/side)</li> <li>Terminals for contactor coils (for frame sizes S0 to S3)</li> <li>Mechanical connectors</li> <li>Wiring modules</li> </ul>
Terminals for contactor coils	To reach the coil terminals A1 and A2 of the contactor combinations for reversing more easily from contactors of frame sizes S2 and S3, you can use terminals for contactor coils. For each combination, 2 x A1 and 1 x A2 are required.
Wiring module	Wiring modules are available to enable you to carry out different types of wiring (Dahlander wiring, for example). You can find out how to mount the wiring modules in the diagrams of the self-assembly kits.
Mechanical interlocking	<ul> <li>Mechanical interlocking (for frame sizes S0 to S3) is available in 2 variants:</li> <li>Attachable at the front (contactor spacing: 0 mm)</li> <li>Attachable at the side (for frame sizes S0 to S3) with integrated NC contact for electronic interlocking</li> </ul>

#### Note

If you want NC contact interlocking, you must use contactors with 1 NC contact in the basic unit with the 3RT1 contactors of frame size S00.

The following graphics show you how to mount the locking devices at the front for mechanical interlocking in frame size S0:

Figure 3-15: Star-delta combination, locking device at the front (frame size S0)

The following graphics show you how to mount the locking devices at the front for mechanical interlocking with frame sizes S2 and S3:

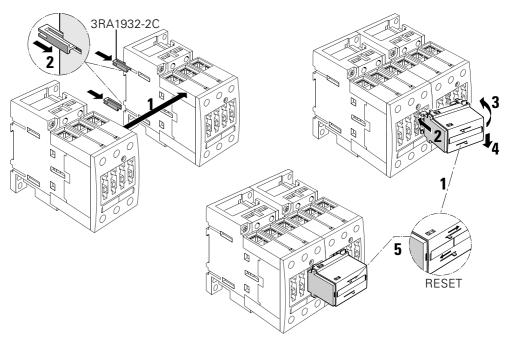

Figure 3-16: Star-delta combination, locking devices at the front (frame sizes S2/S3)

The following accessories are components of the self-assembly kits and they are described in the diagrams of the relevant kit:

- Lateral locking device
- Mechanical connectors
- Wiring modules

The following table shows you the components of the kit for the contactor combination for reversing in frame size S00 and explains how to put it together:

Drawing: frame size S00	Step	Procedure
5 Sclicz	1/2/3	Mount the mechanical inter- lock between the two contac- tors.
	4/5	Press the two connecting clips from above and below onto the two contactors.
	6	Attach the wiring modules to connect the main conducting paths and to electrically inter- lock the two contactors (3RT10.1). Make sure that the wiring modules are flush with the contactor at the side.

Table 3-16: Assembling the contactor combination for reversing (frame size S00)

**Electrical interlock** 

#### Note:

Contactors with an NC contact in the basic unit (3RT101.) are required for the electrical interlock.

#### Kits

	5/6	Attach the wiring modules <b>(5)</b> in order to connect the main conducting paths and tighten the terminals <b>(6)</b> .

Table 3-18: Assembling the contactor combination for reversing (frame sizes S2/S3)

#### 4-pole contactor combination for reversing

4-pole contactor combinations for reversing are available in frame sizes S0 and S2. You will require the following to mount these combinations:

- Frame size S0: locking device for mechanical interlock
- Frame size S2: locking device for mechanical interlock and 2 connecting clips

The following table shows you how to set up the 4-pole contactor combination for reversing in frame size S0:

Drawing: frame size S0	Step	Procedure
	1/2	Remove the 4th pole from one of the two contactors by releasing the snap catch (1).
clic 3 4 0 0 0 0 0 0 0 0 0 0 0 0 0	3/4	Put the 4th pole on the other side of the same con- tactor by placing the cat- ches on the pole into the openings shown on the con- tactor and snapping the pole onto the contactor.

Figure 3-18: 4-pole contactor combination for reversing (frame size S2)

## NO contact function not locked

If contactors are used with 1 NO contact that is intended for an auxiliary function (e.g. as a signaling device), the wiring module must be separated. The illustration below shows you the wiring for this function:

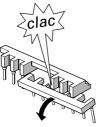

Figure 3-19: NC contact interlock (frame size S00)

Mounting and connec- tion	The contactor combinations for reversing have screw-type connections that are suitable for both screw-on and snap-on mounting on a 35 mm rail.
Conductor cross-sec- tions	The permissible conductor cross-sections of the contactor combinations for reversing correspond to those of the basic units for the corresponding frame size.

**Technical specifications** The technical specifications of the contactor combinations for reversing correspond to those of the basic units for the corresponding frame size.

#### 3.3.9 Star-delta combinations

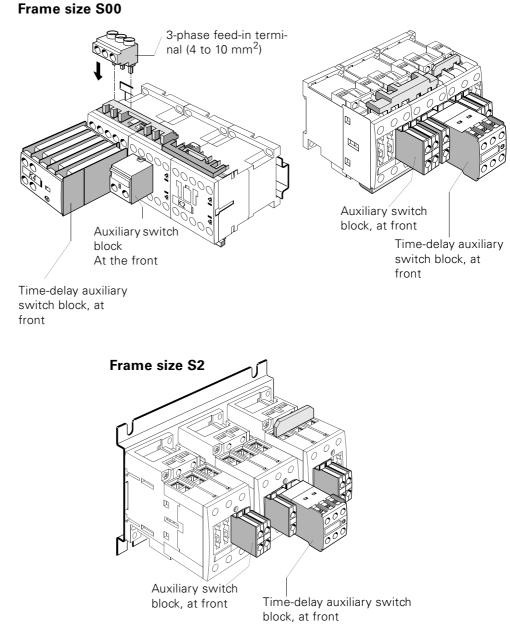

The 3RA1 star-delta combinations in frame sizes S00 to S3 are available as follows:

- Fully assembled with the usual auxiliary switches in the following frame sizes:
  - S00-S00-S00
  - S0-S0-S0
  - S2-S2-S0
  - S2-S2-S2
  - S3-S3-S2

Frame sizes S2 to S3 are delivered already mounted on a base plate.

• As a kit for self-assembly

The same accessories can be used as for the basic units of the corresponding frame size (see Section 3.4, "Contactor accessories").

The following graphics show you the fully assembled star-delta combinations in frame sizes S00 to S2:

Figure 3-23: Star-delta combinations (frame sizes S00, S0, S3)

	Frame size S2
	Time-delay auxiliary switch block, at side
	Figure 3-24: Star-delta combination (frame size S2)
Field of application	The star-delta combination is used to start three-phase induction motors which require a low load torque during startup.
Starting current ratio	Star-delta starting can only be used when the motor is switched to delta mode, starts with no load, or if the load torque during the star startup is small and does not increase rapidly. In the star stage, the motors can be loaded with approximately 50 % (torque class KL16) and 30 % (KL10) of its rated torque. The tightening torque is reduced to approximately 1/3 of the value at direct power-up. The starting current is approximately 2 to 2.7 times the rated current for the motor.
Switchover	Switching from the star to the delta stage can only be carried out once the motor has completed startup to the rated speed. The required switchover pause and interlock is included in the contactor combination.
	<b>Important</b> Drives that require an early switchover are not suitable for star-delta star- ting.
Overload protection	The fully assembled combinations are not equipped with overload protection. Overload relay (3RU11) and tripping devices for thermistor motor protection must be ordered separately. The overload relays can be attached to the contactor directly or set up separately. The overload relay is set to 0.58 times the set current $I_e$ . See Chapter 4 on overload relays for further information.

#### Features of the stardelta combinations

The following table shows you the features of the fully assembled star-delta combinations with time-delay auxiliary switch blocks with the star-delta function (3RT19.6-2B...) and solid-state time relays with semiconductor output and the possible configuration if you use the self-assembly kit:

	Frame size S00	Frame sizes S0 to S3
Fully assembled	At front (time-delay auxiliary switch block)	Lateral (time relay)
Kit	At front	<ul> <li>Lateral (time relay)</li> <li>At front (time-delay auxiliary switch block)</li> </ul>

Table 3-19: Configuration of the star-delta combinations

#### Important

If a time-delay auxiliary switch block is mounted on the front of K3, an auxiliary switch block can only be mounted on the side of K3.

#### Accessories

The following basic unit accessories can also be used for star-delta combinations:

- Auxiliary switch blocks (front, side)
- Surge suppressors
- Time-delay auxiliary switch blocks with star-delta function

In addition, there are special accessories available for the star-delta combinations:

- 3-phase feed-in terminals
- Star-point links (parallel links)
- Terminals for contactor coils (S2/S3)
- Mechanical connectors
- Wiring modules

#### Terminal for contactor coils

In order to reach coil terminals A1 and A2 in the star-delta combination better from contactors in frame sizes S2 and S3, terminals for contactor coils can be used. For each combination, 2 x A1 and 1 x A2 are required.

Infeed

With conductor cross-sections >  $2 \times 2.5 \text{ mm}^2$  and  $1 \times 4 \text{ mm}^2$ , a feed-in terminal block must be used for the star-delta combination in frame size S00. This makes the following conductor cross-sections possible:

- Frame size S00: up to 6 mm<sup>2</sup>
- Frame size S0: up to 25 mm<sup>2</sup>
- Frame size S2: up to 50 mm<sup>2</sup>

Kits

The following table shows you the components of the kit for the star-delta combination in frame size S00 and explains how to put it together:

Drawing: frame size S00	Step	Procedure
5 Sclicz	1/2/3	Mount the mechanical inter- locks between the K2 star con- tactor and the K3 delta contac- tor <b>(1, 2)</b> .
	4/5	Press the two connecting clips from above and below onto the two contactors <b>(3)</b> . Make sure the clips are on the correct side.
7.	6/7	Break the upper link module off at the notches (6), and attach the wiring modules (7) to con- nect the main conducting paths (between line contactor K1 and delta contactor (K3) and at the same time to interlock the com- bination electrically (K3-K2).
	8/9	Wire A2 <b>(8)</b> , and tighten the terminal screws <b>(9)</b> .

Table 3-20: Assembly of the star-delta combination in frame size S00

The following table shows you the components of the kits for the star-delta combinations in frame sizes S0 to S3 and explains how to put it together:

Drawing: frame size S0	Step	Procedure
		Attach the wiring modules and the star-point link in order to connect the main conducting paths and to interlock the combination electrically.
Drawing: frame size S2 (S3)	Step	Procedure
	1/2	Place the star-point link on the star contactor <b>(1)</b> . Tighten the main connec- tions <b>(2)</b> .
	3	Place the wiring module on the contactor undersides (3) to connect the main conduc- ting paths.
Drawing: frame sizes S3-S3-S2	Step	Procedure
	1	Attach the star-point link to the star contactor <b>(1)</b> .
	2	Attach the wiring module to the contactor undersides (2) to connect the main conduc- ting paths.

Table 3-21: Assembly of the star-delta combinations in frame sizes S0 to S3

Compensating for different depths
 In star-delta combinations with contactors of different frame sizes, it is necessary to compensate for the mounting depth of the smaller contactor. One frame size is the maximum difference possible. The following depth compensation must be made for a mechanical interlock attached at the side:

 S2-S2-S0: K3: 1.5 mm; K2: 0 mm
 S3-S3-S2: K3: 0 mm; K2: 27.5 mm

 Mounting and connection
 The star-delta combinations have screw-type connections that are suitable for both screw-on and snap-on mounting on the 35 mm rail.
 Conductor cross-sections of the star-delta combinations cortex.

Conductor cross-sections The permissible conductor cross-sections of the star-delta combinations correspond to those of the basic units for the corresponding frame size.

### 3.4 Accessories

Accessories for frame size S00 The accessories for contactors that switch motors and for auxiliary contactors are of the same type. The accessories are attached at the front.

Acces	ssories	for	frame
sizes	S0 to S	53	

The accessories are (with few exceptions) the same for frame sizes S0 to S3. They can be attached in different ways:

- Auxiliary switches can be attached at the front or the side.
- Surge suppressors can be attached at the top or the bottom.

The following graphic shows you the accessories for the contactors that switch motors and for the contactor relays of frame size S00:

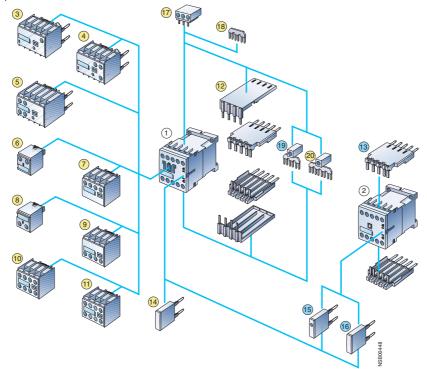

Figure 3-28: Accessories for contactors of frame size S00

- 1 Contactor, frame size S00
- **2** Contactor relay
- **3** Solid-state time relay block, on-delay
- 4 Solid-state time relay block, off-delay
- 5 Auxiliary switch block, time-delay
- (on-delay or off-delay or star-delta function)
- 6/7 1-pole auxiliary switch block, infeed from above or below
- 8/9 2-pole auxiliary switch block, infeed from above or below
- **10** 4-pole auxiliary switch block (terminal markings in acc. with EN 50 012 or EN 50 005)
- 11 2-pole auxiliary switch block, standard or electronic type
- **12** Soldering pin adapter for contactors with 4-pole auxiliary switch block
- 13 Soldering pin adapter for contactors and contactor relays
- 14 Additional load module to increase the permissible residual current

15/16 Surge suppressor with and without LED

- **17** 3-phase feed-in terminal
- **18** Parallel link (star-point link), 3-pole, without terminal
- **19** Parallel link, 3-pole, with terminal
- **20** Parallel link, 4-pole, with terminal

The following graphic shows you the accessories for the auxiliary contactors and contactor relays for auxiliary circuits of frame size S00:

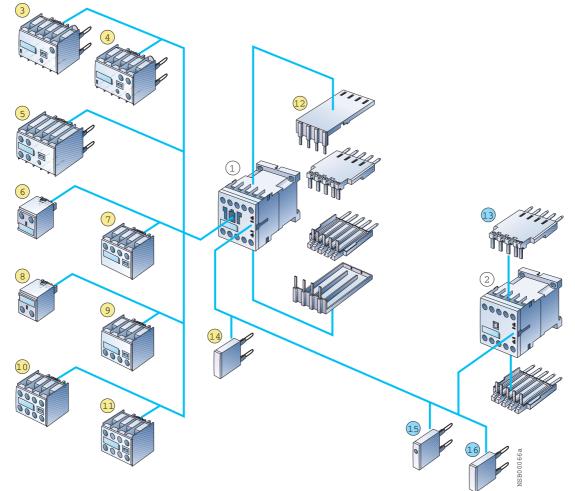

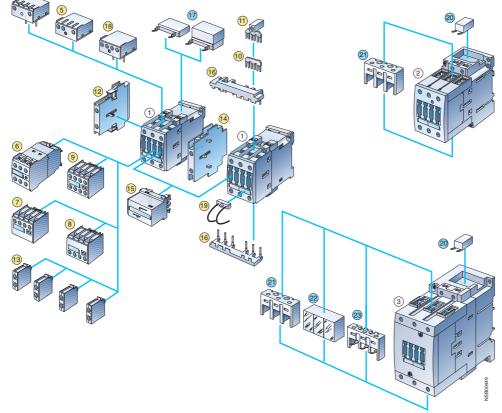

Figure 3-29: Accessories for auxiliary contactors/contactor relays of frame size S00

- **1** Auxiliary contactor
- 2 Contactor relay for auxiliary circuits
- **3** Solid-state time relay block, on-delay
- 4 Solid-state time relay block, off-delay
- **5** Auxiliary switch block, time-delay (types: on-delay or off-delay)
- 6 1-pole auxiliary switch block, infeed from above
- 7 2-pole auxiliary switch block, infeed from above
- 8 1-pole auxiliary switch block, infeed from below
- 9 2-pole auxiliary switch block, infeed from below
- 10 4-pole auxiliary switch block (terminal markings in acc. with EN 50 011 or EN 50 005)
- **11** 2-pole auxiliary switch block, standard or electronic type
- (terminal markings in acc. with EN 50 005)
- **12** Soldering pin adapter for auxiliary contactors with 4-pole auxiliary switch block
- **13** Soldering pin adapter for auxiliary contactors and contactor relays
- 14 Additional load module to increase the permissible residual current
- **15** Surge suppressor with LED
- 16 Surge suppressor without LED

The following graphic shows you the accessories for the contactors of frame sizes S0 to S3:

Figure 3-30: Accessories for contactors of frame size S00

- 1 Contactor, frame size S0
- 2 Contactor, frame size S2
- 3 Contactor, frame size S3

#### For frame sizes S0 to S3:

- 4 Solid-state time relay block, on-delay
- **5** Solid-state time relay block, off-delay
- 6 Auxiliary switch block, time-delay (on-delay or off-delay or star-delta function)
- **7** 2-pole auxiliary switch block, infeed from above
- 8 2-pole auxiliary switch block, infeed from below
- 9 4-pole auxiliary switch block (Terminal markings in acc. with EN 50 012 or EN 50 005)
- **10** Parallel link (star-point link), 3-pole without terminal
- 11 Parallel link, 3-pole, with terminal
- **12** 2-pole auxiliary switch block, attachable on the right or left side (Terminal markings in acc. with EN 50 012 or EN 50 005)
- **13** 1-pole auxiliary switch block (a maximum of 4 can be snapped on)
- **14** Mechanical interlock, attachable at the side
- 15 Mechanical interlock, attachable at the front
- **16** Wiring modules above and below (reversing operation)
- **17** Surge suppressor (varistor, RC element, diode combination), attachable above or below (different for S0 and S2/S3)
- **18** Coupling link for direct attachment to the contactor coil
- **19** LED block to display the contactor function

#### For frame sizes S2 and S3 only:

- 20 Terminal for contactor coil for assembling contactor combinations
- **21** Terminal cover for box terminals

#### For frame sizes S3 only:

- 22 Terminal cover for lug connection and bar connection
- 23 Auxiliary connecting lead terminal, 3-pole

### 3.4.1 Attachable auxiliary switches for extending the auxiliary contacts

Integrated auxiliary contacts	<b>Frame size S00</b> The contactors of frame size S00 have an auxiliary conducting path inte- grated in the basic unit.
	<b>Frame size S0 to S3</b> The contactors of frame sizes S0 to S3 do not have an integrated auxiliary conducting path in the basic unit.
Auxiliary switch blocks Formats	<ul> <li>Auxiliary switch blocks for extending the auxiliary contacts are available with screw-type or Cage Clamp terminals to attach to contactors to switch motors. They are available in the following formats:</li> <li>At the front 1 to 4-pole for frame sizes S00 to S3</li> <li>At the side: 2-pole for frame sizes S0 to S3</li> </ul>
	<ul> <li>Different auxiliary switch blocks can be added to the 3RT1 basic units, depending on the application:</li> <li>The following can be snapped onto the front of the contactors:</li> <li>Frame sizes S00 to S3: a 4-pole auxiliary switch block or</li> <li>Frame sizes S0 to S3: up to four 1-pole auxiliary switch blocks</li> </ul>
	<b>Frame sizes S0 to S3</b> If the depth of the installation space is limited, 2-pole auxiliary switches can be attached on the right and left side in frame sizes S0 to S3. If 1-pole auxiliary switch blocks are used, note the location ID on the contac- tor.
1-pole/2-pole auxiliary switch blocks	1 or 2-pole auxiliary switch blocks that can be connected from above or below make the wiring simple and straightforward when setting up feeders. These auxiliary switch blocks are only available with a screw-type terminal. We recommend with the circuit breaker/contactor combination that you use auxiliary switch blocks that are connected from below. In the case of the contactor/overload relay combination, an auxiliary switch connected from above is more suitable.

#### Electronically optimized auxiliary switch blocks

The electronically optimized auxiliary switch blocks contain enclosed switching elements that are particularly suitable for switching low voltages and currents (hard gold-plated contacts) as well as for use in dusty atmospheres. The rated operational current is  $I_e$ /AC-14 and DC-13: 1 to 300 mA, voltage: 3 to 60 V.

The electronically optimized auxiliary switch blocks are available as screwtype or Cage Clamp terminal types:

- Frame size S00 (3RH1911-.NF..): Has two enclosed auxiliary contacts (1 NO contact + 1 NC contact, 2 NO or 2 NC contacts
- Frame sizes S0 to S3 (3RH1921-.FE22): Has two enclosed auxiliary contacts and two standard auxiliary contacts, each 1 NO contact + 1 NC contact
- The switched current is in acc. with the VDE 0435 regulation for relays.

#### **Auxiliary contacts**

The following table gives you an overview of all the available auxiliary contacts:

Auxiliary contacts and atta- chable accessories	Frame size S00	Frame sizes S0 to S3
Integrated auxiliary contact	1 integrated auxiliary contact	
4-pole auxiliary switch	Attachable at the front	Attachable at the front
2-pole auxiliary switch	Attachable at the front	
1-pole auxiliary switch		Attachable at the front
1-pole auxiliary switch (infeed from 1 side)	Attachable at the front	
2-pole auxiliary switch (infeed from 1 side)	Attachable at the front	Attachable at the front
2-pole auxiliary switch		Attachable at the side
Time-delay auxiliary switch blocks	Attachable at the front	Attachable at the front
Electronically optimized auxil- iary switches	Attachable at the front	Attachable at the front

Table 3-22: Auxiliary switch blocks

## Adding to the auxiliary contacts

- The 3RT10 basic units of frame size S00 with an integrated auxiliary contact can be supplemented with up to 4 contacts using attachable auxiliary switches.
  - The basic units of frame sizes S0 to S3 do not have any auxiliary switches, but auxiliary switches can be attached at the front or the side.

Frame size	Auxiliary switch block	Connection		
S00	1, 3 and 4-pole (attachable at the front)	Screw-type/Cage Clamp terminal		
	<ul> <li>Feeder auxiliary switch (attachable at the front):</li> <li>1-pole (1 NO or 1 NC contact)</li> <li>2-pole (1 NO + 1 NC or 2 NO contacts) Infeed from above or below possible</li> </ul>	Screw-type termi- nal		
S0 to S3	1, and 4-pole (attachable at the front) 2-pole (attachable at the side)	Screw-type/Cage Screw-type termi- nal Clamp terminal		
	<ul> <li>Feeder auxiliary switch (attachable at the front):</li> <li>2-pole (1 NO + I NC contact)</li> <li>2-pole (2 NO or 2 NC contacts)</li> <li>Infeed from above or below possible</li> </ul>	Screw-type termi- nal		

The following table shows you the expansion options for the different frame sizes:

Table 3-23: Expansion options for auxiliary switch blocks

**Auxiliary switch at front** Auxiliary switches that can be attached at the front are hooked into the opening of the contactors and pulled down until they snap into place. They can be removed using the release lever in the middle.

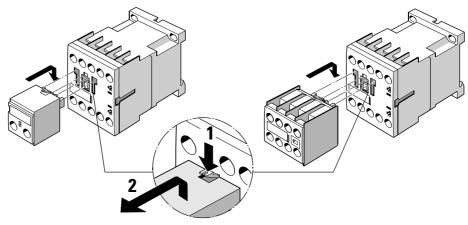

Figure 3-31: Auxiliary switch at front

## Auxiliary switches at side (S0 to S3)

The auxiliary switches are hooked onto the left or right side of the contactor and snapped onto it. They are removed again by pressing the ribbed surfaces.

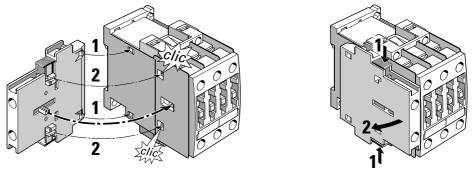

Figure 3-32: Auxiliary switch at side

#### Note

When you use two 2-pole, auxiliary switches at the side, you must attach an auxiliary switch block on the left and right in the interests of symmetry.

## Maximum number of auxiliary switches

The following table shows you the maximum number of auxiliary switches and their combination options:

#### Frame size S0 and S2 (3RT102./3RT103.)

1 auxiliary contact element	4 auxiliary contact elements	2 auxiliary contact elements		
		<u>{                                    </u>		
Max. 4	0	0		
Max. 2	0	1		
0	1	0		
0	0	1+1		

A maximum of 4 auxiliary contacts can be attached, and you can use any type of auxiliary switch. When you use two 2-pole, auxiliary switch blocks at the side, you must attach a block on the left and right in the interests of symmetry. In some situations, it is permissible to have more auxiliary contacts in frame size S2 (for more details, please contact Technical Assistance).

Table 3-24: Possible auxiliary switch combinations (frame size S0/S2)

#### Frame size S3 (3RT104./3RT14)

Traine							
1 auxil conta elem	act	4 auxiliary contact elements	2 auxiliary contact elements	A maximum of 8 auxiliary contacts can be attached. Please note the follow- ing:			
C C			the second se	Of these 8 auxiliary contacts, a maxi- mum of four can be NC contacts. Symmetry must be preserved in the			
4		0	1+1	case of auxiliary switch blocks attached at the side.			
0		1	1+1				
0		0	2+2				

Table 3-25: Possible auxiliary switch combinations (frame size S3)

			U		
	S00	SO	S2/S3		
Contactors with 4 main contacts	4 auxiliary con- tacts	Maximum of 2 auxiliary contacts (attached at the side or snapped on at the top)	Maximum 4 auxiliary contacts (attached at the side or snapped on at the top)		
Capacitor-swit- ching contactors	An additional 2-pole auxiliary switch block on each side (3RH1921-1EA: 2 NO, 2 NC or 1 NO + 1 NC contact)				

#### Contactors with 4 main contacts and capacitor-switching contactors

Table 3-26: Possible auxiliary switch combinations with 4-pole/capacitor-switching contactors

Switching of the auxiliary contact elements With the standard type of auxiliary switch, when the contactors are switched on, first the NC contacts are opened and then the NO contacts are closed.

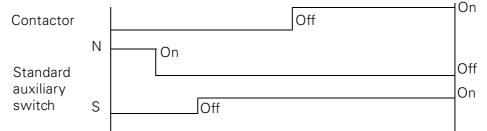

Figure 3-33: Switching of the auxiliary contact elements

Auxiliary contact elements with makebefore-break contacting

S00	Auxiliary switch type	S0 - S3	Auxiliary switch type
3RH1911-1FC22	22U, 2 NO + 2 NC contacts Screw-type terminal	3RH1921-1FC22	22U, 2 NO + 2 NC contacts Screw-type terminal
3RH1911-1FB11	11U, 1 NO + 1 NC contact Screw-type terminal		
3RH1911-1FB22	11/11U. 1 NO+1 NC+1PS <sup>1</sup> ) +1lagging NC contact Screw-type terminal		
3RH1911-2FC22	22U, 2 NO + NC contact Cage Clamp		
3RH1911-2FB11	11U, 1 NO + 1 NC contact Cage Clamp	3RH1921-1CD10	1 NO contact, lead- ing Screw-type terminal

		3RH1921-2FC22	22 U, 2 NO + 2 NC Cage Clamp

Table 3-27: Auxiliary switches with make-before-break contacting 1) Leading NO contact

#### 3.4.1.1 Terminal markings of the contactors (frame sizes S00 to S3)

In contactors of frame size S00 with an integrated auxiliary contact, the terminal marking complies with EN 50 012. This also applies to contactors of frame sizes S0 to S3 with an attached auxiliary switch block (2 NO + 2 NCcontacts) that are available as complete systems.

#### Expanding the contactors of frame size S00

All the contactors of frame size S00 (3 and 4-pole) can be expanded with auxiliary switch blocks with the identification numbers 40 to 02 in acc. with EN 50 005 as follows:

- Frame size S00 with an integrated auxiliary contact (identification number 10E or 01) for contactors with 3 or 5 auxiliary contacts
- Frame size S00 with 4 main contacts for contactors with 2 or 4 auxiliary contacts

#### Note

The identification numbers on the auxiliary switch blocks only apply to the attached auxiliary switches.

Expanding the contactors with 1 integrated NO contact, S00 (3RT101.-...01) Contactors with one NO contact as an auxiliary contact with screw-type or Cage Clamp terminals, identification number 10E, can be expanded with auxiliary switch blocks with terminal markings in acc. with DIN EN 50 012 for contactors with 2, 4, and 5 auxiliary contacts. The terminal markings of the complete contactors comply with EN 50 012. The identification numbers 11E, 22E, 23E, and 32E on the auxiliary switch blocks apply to the complete contactors.

#### Important

Auxiliary switch blocks in acc. with EN 50 012 can only be combined with contactors of frame size S00 that have 1 NO contact in the basic unit because they are coded. These auxiliary switch blocks cannot be combined with contactors that have an NC contact in the basic unit (identification number 01).

# Auxiliary contacts S00 The following graphic shows you the auxiliary contacts that can be used to expand the contactors of frame size S00 (terminal marking in acc. with EN 50 012 or EN 50 005):

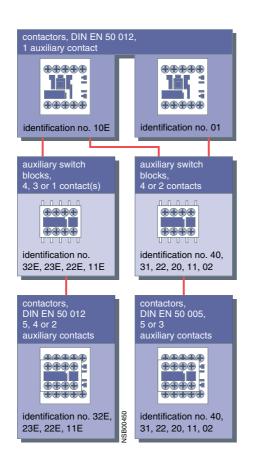

Figure 3-34: Auxiliary contacts, contactors for switching motors (frame size S00)

#### Expanding the contactors of frame sizes S0 to S3

With contactors of frame sizes S0 to S3, you can also attach 1-pole auxiliary switch blocks instead of 4-pole auxiliary switch blocks. The terminal markings of the 1-pole auxiliary switch blocks consist of sequence numbers (location ID) on the basic unit and function numbers on the auxiliary switch blocks.

## Auxiliary contacts S0 to S3

The following graphic shows you the auxiliary contacts that can be used to expand the contactors of frame sizes S0 to S3 (terminal marking in acc. with EN 50 005 or EN 50 012):

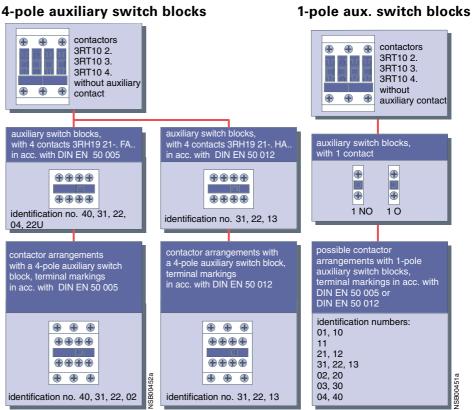

Figure 3-35: Auxiliary contacts, contactors for switching motors (frame sizes S0 to S3)

## 3.4.1.2 Terminal markings of the contactors and auxiliary contactors combined with auxiliary switch blocks

Terminal markings in The terminal markings for contactors are defined in EN 50 005 that contains acc. with EN 50 005 general directives. The following summarizes the basic rules that apply to switching elements of auxiliary circuits: The terminals of auxiliary contact elements are designated by two-digit numbers. • The digit in the unit place is a function number (NC contact: 1 and 2, NO contact: 3 and 4). • The digit in the tens place is a sequence number (all the switching elements of the same function must have different sequence numbers). Identification numbers The identification numbers mean: (DIN EN 50 005) Switching devices with a fixed number of auxiliary contact elements (NO contacts or NC contacts) can be assigned a two-digit identification number. The first digit represents the number of NO contacts and the second one the number of NC contacts. There is no information on the sequence of NO contacts and NC contacts in the contactor/auxiliary contactor.

#### Note

The identification numbers on the auxiliary switch blocks only apply to the attached auxiliary switches.

EN 50 012/For certain equipment such as auxiliary contact elements of contactors and<br/>auxiliary contactors, the EN 50 012 and EN 50 011 standards also apply.<br/>The EN 50 012 defines the terminal markings and identification numbers for<br/>auxiliary contact elements of particular contactors.<br/>The terminal markings of the auxiliary contact elements match the terminal<br/>markings of corresponding auxiliary contact elements of contactors with the ID letter E (in acc.<br/>with EN 50 011). For auxiliary contact elements of contactors with the same<br/>identification number, the terminal marking must correspond to the<br/>sequence defined in the standard.

### Graphical symbols for auxiliary contact elements

Below are some examples of graphical symbols for auxiliary contact elements of contactors that comply with EN 50 012:

Coil	Main contact elem.	ID no.	Auxiliary contact elements	ID no.	Auxiliary contact elements ID no. Auxiliary contact elements
		31	13 21 33 43 0 0 0 0 14 22 34 44	22	13     21     31     43       0     0     0       13     21     31     41       0     0     0     0       14     22     32     44
		41	13     21     33     43     53       0     0     0     0     0       0     0     0     0     0       14     22     34     44     54	32	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$

Figure 3-36: Graphical symbols for auxiliary contact elements in acc. with EN 50 012 (excerpt)

#### Device circuit diagrams

The following device circuit diagrams of the auxiliary switch blocks for contactors that switch motors contain the terminal markings in acc. with EN 50 012:

#### 3RT101 contactors

2 NO + 2 NC contacts Identification number: 22E 2 NO + 3 NC contacts Identification number: 23E

→ A1(+)|1 |3 |5 |13|21 |31|41 |53

3 NO + 2 NC contacts Identification number: 32E

#### Contactors 3RT102, 3RT103, 3RT104, 3RT1446

2 NO + 2 NC contacts Identification number: 22

## 4-pole auxiliary switch blocks 3RH1921-1HA.., can be snapped onto the front

3 NO contacts + 1 Identification no.: 31E 2 NO + 2 NC contacts

1 NO + 3 NC contacts

Figure 3-37: Device circuit diagrams of the auxiliary switch blocks (DIN EN 50 012)

#### 3.4.1.3 Auxiliary switches that can be attached to 3RH1 auxiliary contactors

The 3RH1 auxiliary contactors can be expanded by up to 4 contacts using attachable auxiliary switch blocks.

Definition:The main standard for the designation of switching elements for the auxiliary<br/>contactors is EN 50 011, which defines the terminal markings, identification<br/>numbers, and identification letters of certain auxiliary contactors using a spe-<br/>cific sequence of the switching elements. The number, type, and position of<br/>the switching elements must be specified using an identification number fol-<br/>lowed by an identification letter.

In the case of 8-pole auxiliary contactors, the letter "E" means that four NO contacts have to be arranged on the lower (rear) contact level.

Expansion using auxil-<br/>iary switch blocksThe following example of an auxiliary contactor with 4 NO contacts (contact<br/>designation in acc. with EN 50 011 and EN 50 005) explains how auxiliary<br/>switch blocks are added on:

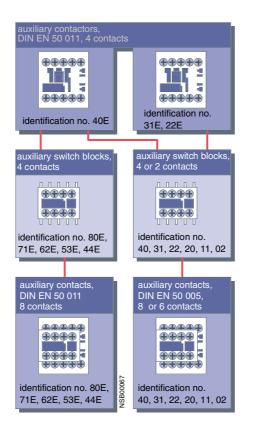

Figure 3-38: Auxiliary contacts for auxiliary contactors

**Contact designation** Auxiliary switch blocks - for example, 3RH1911-1GA22 (2 NO + 2 NC contacts) in acc. with EN 50 011 - can only be attached to auxiliary contactors with 4 NO contacts (3RH1140-.....) because they are coded. The identification number (62E) printed on the auxiliary switch block (6 NO + 2 NC contacts) applies to the whole contactor. NO and NC contacts are in the same position on all the auxiliary contactors with the identification number 62E (DIN EN 50 011). This means contactors can be replaced without changing the wiring, which therefore makes wiring very easy. You can attach auxiliary switch blocks that comply with EN 50 005 on all 3RH11 auxiliary contactors and 3RT101 motor contactors. For example, the 3RH1911-1FA22 auxiliary switch block (2 NO + 2 NC contacts) has the identification number 22, and this only applies to the attached auxiliary switch block.

### Graphical symbols of the auxiliary contactors

Below are some examples of graphical symbols for auxiliary contactors with the identification letter E that comply with EN 50 011:

ID no.	Coil	Switching elements	] [	ID no.	Coil			Swite	ching el	ements			
40 E		13     23     33     43       0     0     0     0       0     0     0     0       14     24     34     44		80 E		13 0 0 14	23 0 0 24	33 0 0 34	43 0 0 44	53 0 0 54	63 0 0 64	73 0 0 74	83 0 1 0 84

The following position diagrams of the auxiliary switches of frame sizes S00 to S3 also apply to leading and lagging contacts:

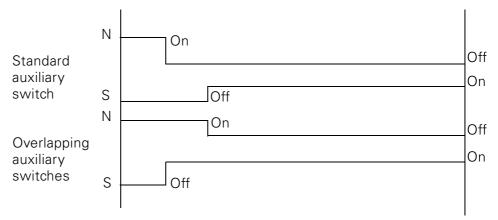

Figure 3-41: Position diagrams of the auxiliary switches (frame sizes S0 to S3)

### 3.4.2 Time-delay auxiliary switches

Variants	<ul> <li>The following variants of the time-delay auxiliary switch are available:</li> <li>On-delay</li> <li>Off-delay without auxiliary supply</li> <li>Star-delta function</li> </ul>
On-delay and off-delay functions	<ul> <li>The time-delay auxiliary switch in the on-delay or off-delay variants has the following features:</li> <li>It facilitates time-delayed functions up to 100 s</li> <li>3 single time areas</li> <li>Contains a relay with 1 NO contact and 1 NC contact that switches the on-delay or off-delay depending on the version.</li> </ul>
Star-delta function	<ul> <li>The time-delay auxiliary switch with star-delta function has the following features:</li> <li>Equipped with a delayed and an instantaneous NO contact between which there is an idle time of 50 ms.</li> <li>The delay time of the NO contact can be set at between 1.5 s to 30 seconds.</li> <li>The contactor on which the time-delay auxiliary switch block is mounted functions instantaneously.</li> </ul>
Conductor cross-sec- tions	The permissible conductor cross-sections correspond to the auxiliary con- ductor terminals of the corresponding frame size.
3.4.2.1 Frame size S00	(3RT1916-2E, -2F, -2G)
Description	<ul> <li>The time-delay auxiliary switch of frame size S00 has the following features:</li> <li>The power supply is provided using plug-in contacts directly via the coil connections of the contactors, parallel to A1/A2.</li> <li>The time function is activated when the contactor that has the auxiliary switch block mounted on it is switched on.</li> <li>The off-delay version functions without an auxiliary supply.</li> <li>The minimum on-time is 200 ms.</li> <li>To dampen switching overvoltages of the contactor coil, a varistor is integrated in the time-delay auxiliary switch of frame size S00.</li> </ul>

Information on mount-	Note about the off-delay without auxiliary supply function:
ing	The position of the output contacts is not defined at shipment (bistable
	relay). Apply the control supply voltage once, and then switch it off again to
	set up the initial state of the contacts.

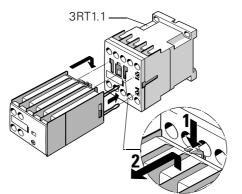

#### Important

The time-delay auxiliary switch cannot be built onto contactor relays.

Installation/removal

#### Caution

Switch off the supply voltage to A1/A2 before you install or remove the timedelay auxiliary switch block.

The time-delay auxiliary switch is attached to the front of the contactor.

Figure 3-42: Time-delay auxiliary switch block (frame size S00)

Connection

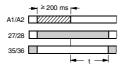

When they are attached, the connections for the rated control supply voltage are connected to the contactor below by the integrated spring contacts of the time-delay auxiliary switch.

Figure 3-43: Function diagrams of the time-delay auxiliary switches (frame size S00)

#### 3.4.2.2 Frame sizes S0 to S3 (3RT1926-2E, -2F, -2G)

Description

ing

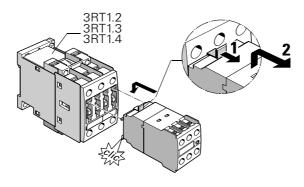

The time-delay auxiliary switch for frame sizes S0 to S3 has the following features:

- The power supply of the time-delay auxiliary switch is via 2 terminals (A1/ A2).
- The time delay for the time-delay auxiliary switch can be activated by parallel connection to any contactor coil, or by any source of voltage.
- The off-delay version works without an auxiliary supply.
- The minimum on-time is 200 ms.
- In addition to the time-delay auxiliary switch, a 1-pole auxiliary switch block can be snapped onto the front of the contactor.
- The time-delay auxiliary switch does not have any integrated overvoltage damping for the contacted contactor.

### Information on mount- Note about the off-delay without auxiliary supply function:

The position of the output contacts is not defined at shipment (bistable relay). Apply the control supply voltage once, and then switch it off again to set up the initial state of the contacts.

#### Installation/removal

The time-delay auxiliary switch is attached to the front of the contactor.

Figure 3-44: Time-delay auxiliary switch block (frame sizes S0 to S3)

Connection	The A1 and A2 terminals for the rated control supply voltage of the time- delay auxiliary switch are connected to the respective contactor with cables.
Terminal markings	Because an additional auxiliary switch block can be snapped onto the con-

tactor, the terminals of the delayed contacts have been designated as -5/-6 (NC contact) and -7/-8 (NO contact).

## Function diagrams

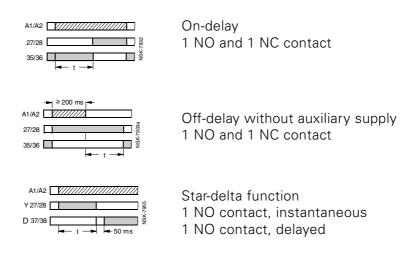

Figure 3-45: Time-delay auxiliary switches, function diagrams (frame sizes S0 to S3)

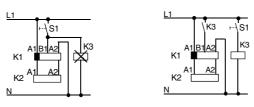

#### 3.4.3 Solid-state time relay blocks with semiconductor output

	The solid-state time relay blocks are suitable for AC and DC operation. To dampen switching overvoltages of the contactor coil, a varistor is integrated.
Variants	<ul> <li>The following variants of the time-delay auxiliary switch are available:</li> <li>On-delay (integrated varistor)</li> <li>Off-delay with auxiliary supply (integrated varistor)</li> </ul>
On-delay and off-delay functions	<ul> <li>The time-delay auxiliary switch in the on-delay or off-delay with an auxiliary supply variants has the following features:</li> <li>It facilitates time-delayed functions up to 100 seconds.</li> <li>3 individual time ranges</li> <li>Contactors with a solid-state time relay block close and open with a delay according to the time set.</li> </ul>
Connection: on-delay time relay block	The on-delay time relay block is connected in series to the contactor coil; the A1 terminal of the contactor coil must not be connected.
Connection: off-delay time relay block	When an off-delay time relay block is attached, the contactor coil is con- tacted via the time relay block; the A1 and A2 terminals of the contactor coil must not be connected.
Conductor cross-sec- tions	The permissible conductor cross-sections correspond to the auxiliary con- ductor terminals of the corresponding frame size.

#### Notes on configuration

The control of loads parallel to the start input is not permissible in AC operation. See the relevant circuit diagram () below.

The off-delay solid-state time relay blocks (3RT1916-2D.../3RT1926-2D...) have a live start input (B1). With AC voltage, this can imitate the control of a parallel load on the B1 terminal. In this case, an additional load (contactor K3, for example) should be wired as shown in circuit diagram <sup>(2)</sup>. <sup>(1)</sup> <sup>(2)</sup>

K1 time relay block K2 contactor

Figure 3-46: Control of loads

#### 3.4.3.1 Frame size S00 (3RT1916-2C, -2D)

#### Caution

Switch off the supply voltage to A1/A2 before you install or remove the solid-state time relay block.

#### Installation/removal

#### Important

The time-delay auxiliary switch cannot be attached to contactor relays.

The solid-state time relay block of frame size S00 is attached to the front of the contactor and latched into place with a pushing movement.

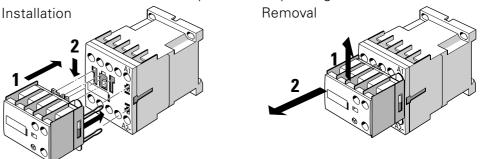

Figure 3-47: Solid-state time relay block with semiconductor output, installation (frame size S00)

#### Connection

When the solid-state time relay block is installed, it is connected at the same time with the A1 and A2 coil connections of the contactor by the plugin contacts. Coil connections of the contactor that are not required are covered by covers on the housing of the time relay block, thus preventing inadvertent connection.

Figure 3-49: Solid-state time relay with semiconductor output, circuit diagrams (frame size S00)

#### 3.4.3.2 Frame size S0 to S3 (3RT1926-2C, -2D)

Note on configuration	<b>Caution</b> The solid-state time relay block with a semiconductor output (3RT1926-2C, -2D) must not be used for 3RT104 contactors of frame size S3 with $U_S \leq 42$ V because the coil current used for the output semiconductor is too high. The solid-state time relay block must not be attached to the lower coil con- nections.

#### Installation/removal

The solid-state time relay block for the contactors of frame sizes S0 to S3 is attached at the top on the A1 and A2 coil connections of each contactor, connecting the time relay electrically and mechanically with pins.

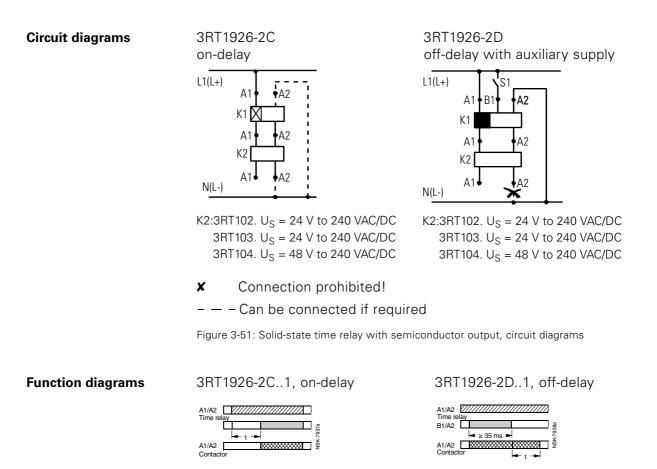

Figure 3-52: Solid-state time relay with semiconductor output, function diagrams

#### 3.4.4 Additional load module (3RT1916-1GA00)

Field of applicationThe additional load module for the contactors of frame size S00 is used to<br/>increase the permissible residual current and to limit the residual voltage of<br/>SIMATIC semiconductor outputs.

Mode of operationMalfunctions can sometimes occur when SIRIUS contactors and auxiliary<br/>contactors of frame size S00 work together with SIMATIC output modules<br/>whose residual current at signal "0" is higher than is permissible for the con-<br/>tactors of frame size S00. The maximum permissible residual current of the<br/>electronic components is 3 mA for contactors of frame size S00 with a<br/>230 VAC drive, and in the case of higher residual currents, the contactors no<br/>longer drop down.<br/>The additional load module is used to ensure the safe switching off of S00<br/>contactors in the case of direct control by programmable controllers via<br/>230 VAC semiconductor outputs.<br/>The additional load module takes on the function of overvoltage damping at<br/>the same time.

Technical specifications	Rated voltage	AC 50/60 Hz 180 V to 255 V
	Rated output power	1.65 W at 230 V
	Permissible contactor types	3RT1.1
		3RT1.
	Associated coil type	P0 (230 V, 50/60 Hz)
		N2 (220 V, 50/60 Hz)
		P6 (220 V, 50Hz/240 V, 60 Hz)
	Operating range	0.8 to 1.1 Us

# Installation The additional load is connected in parallel to the contactor coil. It has the same construction as the surge suppressor and is attached on the front of the contactors with or without an auxiliary switch block.

#### 3.4.5 Coupling element for frame sizes S0 to S3 (3RH1924-1GP11)

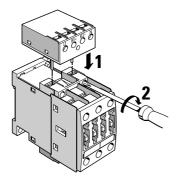

Field of applicationThe 3RH1924-1GP11 coupling link is intended for contactors of frame sizes<br/>S0 to S3. It can be controlled by a programmable controller output because<br/>the operating range of 17 to 30 VDC is permissible.

Mode of operationA contactor of frame size S0 to S3 can be controlled, for example, at 24 VDC<br/>with a low control level (< 0.5 W) from a programmable controller output.<br/>The control voltage for the coupling link and the rated control supply voltage<br/>for the contactor are electrically isolated. An LED indicates the switching<br/>state of the coupling link.<br/>To dampen switching overvoltages of the contactor coil, a varistor is inte-<br/>grated in the coupling link.

Installation

#### Caution

Switch off the supply voltage applied to L1 and N before installation.

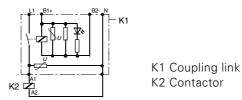

The coupling link is inserted with its two integrated mounting pins directly onto the coil connections of the contactor.

Figure 3-53: Coupling link (frame sizes S0 to S3)

#### Conductor cross-sections

The permissible conductor cross-sections correspond to the auxiliary conductor terminals of the corresponding frame size.

#### **Circuit diagram**

B1+/B2-: Control voltage 24 VDC

L1/N: Rated control supply voltage for the selected contactor

Figure 3-54: Coupling link, circuit diagram (frame sizes S0 to S3)

**Technical specifications** You can find the technical specifications of the coupling link in Section 3.6, Technical specifications.

#### 3.4.6 Surge suppression

When contactor coils are disconnected, overvoltage occurs (inductive load). Voltage peaks of up to 4 kV with a rate of rise in voltage of 1 kV/ms can result (showering arcs).

The consequences of this are:

- Heavy contact erosion and thus premature wearing of the contacts that switch the coil
- Unwanted signals can occur that may cause false signals in electronic controllers.

All contactor coils, therefore, should be damped against switching overvoltages, particularly when working with electronic controllers.

**Oscillograms** The following oscillograms illustrate the behavior at disconnection of contactor coils with and without overvoltage damping:

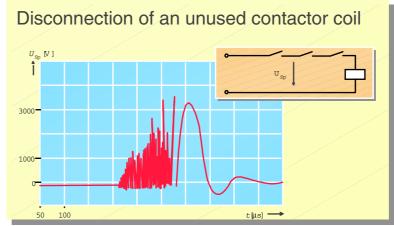

Figure 3-55: Disconnecting an unused contactor coil

Oscillogram of a disconnection of the coil of an auxiliary contactor. The coil is not used:

Showering arcs can be clearly seen (voltage peaks of up to approximately 4 kV). After the disconnection procedure has been started, showering arcs occur for approximately 250 microseconds, and after that the oscillation is merely damped.

### Unused coil

#### Varistor

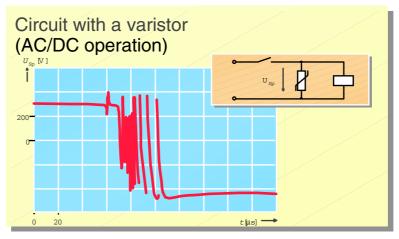

Figure 3-56: Circuit with a varistor (AC/DC operation)

This is what happens when a coil is disconnected that is connected to a varistor (voltage-dependent resistor):

Voltage peaks still occur. They are cut off at approximately 400 V and have a shorter overall duration (approximately 50 microseconds).

(Note: The oscillogram is cut off, and the voltage is reduced to zero after approximately 3 ms.)

A varistor is suitable for AC and DC operation.

The off-delay of the contactor is extended by approximately 2 to 5 ms.

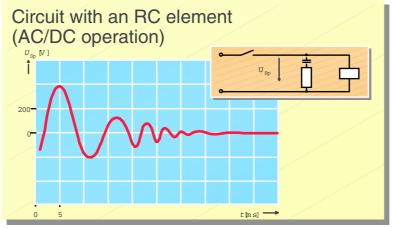

Figure 3-57: Circuit with an RC element (AC/DC operation)

This is what happens when a coil is disconnected that is connected to an RC element:

The amplitude and rate of rise of the switching overvoltage are reduced by the capacitor. Showering arcs no longer occur. The voltage swings briefly to 400 V and then slowly drops down. This represents ideal damping. Disadvantage: The component is larger and generally more expensive. RC elements are suitable for AC and DC operation.

Only a minimal off-delay occurs (under 1 ms).

#### Diode

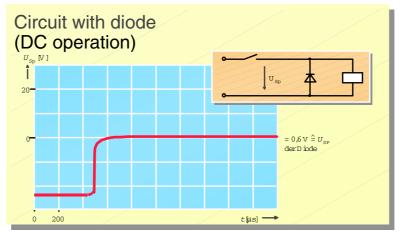

Figure 3-58: Circuit with a diode (AC/DC operation)

This is what happens when a coil is disconnected that is connected to a diode:

Advantages: No overvoltage occurs during disconnection. The diode block becomes effective at 0.6 V.

Disadvantage: The diode can only be used for DC operation.

The break time of the contactor is considerably increased and amounts to 6 to 9 times the off-delay.

This increased break time can be used, if necessary, for control purposes, such as for bridging brief interruptions in voltage.

Zener diodes (diode combinations) are available for shorter break times. The break time then amounts to 2 to 6 times the off-delay.

#### **Surge suppressors** The following surge suppressors are available for the 3RT1 contactors:

Surge suppressor	With LED	Without LED		
	For S00	For S00	For S0	For S2, S3
Suppression diode	х	х		
Diode combination: suppression diode and Zener diode		х	х	х
Varistor	х	х	х	х
RC element		х	х	х

Table 3-28: Surge suppressor

#### Selection aid

The following table gives you a comparison of the effects of the different surge suppressors:

Surge suppressor		Suitable for control supply voltage	Overvoltage is limited	Effect
Suppression diode/ flywheeling diode	¥	DC	0.6 V	<ul> <li>Off-delay is considerably greater (6 to 10 times)</li> <li>A two-stage drop<sup>1)</sup> cannot be ruled out in the case of contactors as of frame size S0</li> </ul>
Diode combination: suppression diode Zener diode	大 字	DC	To Zener voltage	<ul> <li>Off-delay is greater (2 to 6 times)</li> <li>A 2-stage drop no longer occurs</li> </ul>
Varistor	ł	AC/DC	To varistor voltage (current-dependent)	• Off-delay is only slightly greater (2 to 5 ms)
RC element		AC/DC	Corresponds to the dimensioning	<ul><li>Off-delay remains unchanged</li><li>Rate of rise in voltage is damped</li></ul>

Table 3-29: How surge suppressors work

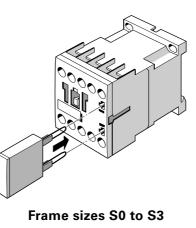

1) The rate of drop is reduced once or twice to zero for a few ms:

• A safe drop is always ensured in the case of switching without current.

• The contact pieces are subjected to a greater thermal load when switching with current. When switching at the upper current limit, this can result in overload.

#### Installation

Frame size S00

The surge suppressor is attached on the front of the contactors. There is space next to the attached auxiliary switch block. The direction of for attachment is defined by a code.

Varistors, RC elements, and diode combinations can either be inserted and snapped on from above or below directly onto the coil terminals.

To remove them, press the varistors, RC elements, and diode combinations forwards, and remove them from the recess.

Figure 3-59: Surge suppressors, installation

Installation instructions for frame sizes S0 to S3

#### Important

The 3RT1926-1E.00 diode combination is inserted from above. The direction of attachment is defined by a code.

Alternatively, the 3RT1926-1T.00 diode combination can be inserted from below. The direction of attachment is not coded, but the terminals are marked with "+" and "-" so that the direction is clear.

#### **Circuit diagrams**

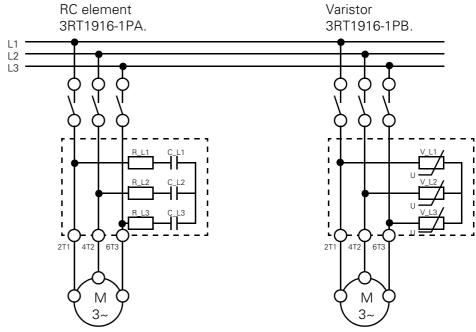

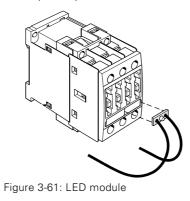

Figure 3-60: RC element/varistor, circuit diagrams

#### 3.4.7 Other accessories

### 3.4.7.1 LED module for indicating contactor control (3RT1926-1QT00)

Description	The LED module can be connected to the coil terminals of the contactors of frame sizes S0 to S3. It indicates the status of the contactors by means of yellow LEDs.
Mode of operation	The LED module can be used for AC/DC voltages of 24 V to 240 V. The LEDs are connected bidirectionally to protect against polarity reversal. Both LEDs light up in AC control, and one lights up in DC control, depending on the polarity.
Connection	The LED module is connected to the A1 and A2 coil terminals of the contac- tor.

**Installation** The LED module is snapped onto the front in the openings intended for the inscription plate.

#### 3.4.7.2 Auxiliary connecting lead terminal, 3-pole (for frame size S3)

Using the 3-pole auxiliary lead terminal, auxiliary and control cables can be connected to the main cable terminals.

Conductor cross-sections of auxiliary connecting leads that can be connected:

Single-core	mm <sup>2</sup>	2 x (0.5 to 1.5); 2 x (0.75 to 2.5) in acc. with IEC 60 947; Max. 2 x (0.75 to 4)
Finely stranded with wire end ferrule	mm <sup>2</sup>	2 x (0.5 to 1.5); 2 x (0.75 to 2.5)
AWG cables, single- or multi-core	AWG	2 x (20 to 16); 2 x (18 to 4); 1 x 12
Terminal screws		M3
Tightening torque	Nm	0.8 to 1.2 (7 to 10.3 lb.in)

Table 3-30: Conductor cross-sections of 3-pole auxiliary connecting lead terminals (for frame size S3)

#### 3.4.7.3 EMC module (3RT1916-1P.)

In the case of motors or various inductive loads, back-e.m.f (electromotive force) is produced at disconnection. This can produce voltage peaks of up to 4000 V with a frequency range of 1 kHz to 10 MHz and a rate of voltage variation of 0.1 to 20 V/ns.

Capacitive coupling to various analog and digital signals makes suppression necessary in the load circuit.

#### **Description** The connection of the main conducting path to the EMC suppression module reduces the contact sparking that is responsible for contact erosion and many of the clicks, which in turn supports an EMC-compatible configuration.

Mode of operation	<ul> <li>The EMV suppression module reduces through 3 phases the radio-frequency parts and the voltage peaks. The advantages of this are as follows:</li> <li>Longer service life of the contact pieces</li> <li>Higher operational reliability and high system availability</li> <li>A fine grading within the performance class is not required because smaller motors have greater inductance due to their construction, and one EMC suppression module is thus sufficient for all non-stabilized drives up to 5.5 kW.</li> </ul>		
Variants	Two electrical variants are available: • RC circuit • Varistor switching		
Installation	Figure 3-62: EMC suppression module	The EMC suppression module is attached to the underside of the contactor. To do this, hook the EMC suppression module with both hooks onto the contactor, and push it upward until the con- nection pins of the EMC module are firmly in place in the terminal openings of the contactor.	
RC circuit	<ul><li>The RC circuit is suitable:</li><li>For reducing the rate of rise</li><li>In RF damping</li><li>Effective suppression can be achieved</li></ul>	red for a wide range of applications.	
Varistor circuit	A varistor circuit can absorb a high level of energy and can be used for fre- quencies from 10 to 400 Hz (stabilized drives). There is no limit below the buckling stress.		

#### 3.4.7.4 Soldering pin connector for frame size S00

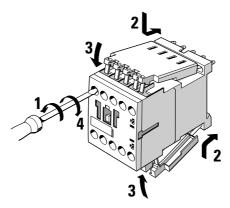

#### Description

The standard contactors of frame size S00 in the SIRIUS range can be soldered onto printed circuit boards by means of the soldering pin adapter. Soldering pin connection is possible:

- For contactors with an integrated auxiliary contact
- For contactors with an attached 4-pole auxiliary switch block
- For the reversing wiring of the S00 contactors. This involves carrying out the reversing wiring before soldering it on the printed circuit board

#### Mounting main contacts

Mounting on 4-pole auxiliary switch block

The soldering pin connectors are inserted above and below in the screwtype terminals of the contactors.

Figure 3-63: Soldering pin connection, mounting

#### Removing the spring

If necessary, the spring for attachment to the rail can be removed before the soldering pin connection is mounted.

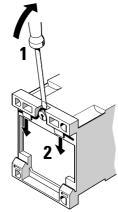

Figure 3-65: Removing the spring from the soldering pin connection

#### 3.4.7.5 Parallel connections

	alle acc eac at t anc Ind	If the conducting paths of multipole switching devices are connected in par- allel, the total current is distributed to the individual conducting paths according to their ohmic resistance and the inductive effect they have on each other. The ohmic resistance is mainly formed by the transfer resistance at the contact pieces, the value of which can be changed by contact erosion and oxidation. The distribution of current is therefore neither even or stable: Individual conducting paths can be overloaded and the overload release or overload relay may be prematurely triggered (triggering fault).				
Permanent load in parallel connection	unk • V a p a n s s s v T t t t	<ul> <li>The following applies to permanent loads in the case of parallel connection unless specified otherwise in the catalogs:</li> <li>When three conducting paths are connected in parallel, 2.5 times the amount of continuous current can be applied, and when two conducting paths are connected in parallel, 1.8 times the continuous current can be applied. Make sure, however, that the making and breaking capacity do not increase because the contact pieces do not close and open at the same time, and therefore the contact pieces in a conducting path have to switch the entire making and breaking current.</li> <li>The wiring must be routed in such a way that each conducting path has the same line length.</li> <li>Any short-circuit current is distributed in proportion to the conducting path resistances.</li> <li>Important: The operating current of electromagnetic, instantaneous short-circuit releases is not reached.</li> </ul>				
Making/breaking capacity	to t	i can find out the n he load currents in hs from the follow	the parallel conne			
		$\begin{array}{c} I_{e} & I_{e} & I_{e} \\ \downarrow & \downarrow & \downarrow & \downarrow \\ I_{e} & I_{e} & I_{e} \\ I_{e} & I_{e} & I_{e} \\ \end{array}$ 3-pole switching <sup>1)</sup>	2 conducting paths in parallel <sup>1</sup>	$1^{\frac{1}{2}}$	4 conducting paths in parallel <sup>1</sup>	
	Making capacity:	12 x I <sub>e</sub> (utilization category AC -4)	$\frac{12 \cdot I'e}{1,8} = 6,67 \cdot I'e$	$\frac{12 \cdot I^{\prime\prime}e}{2,5} = 4, 8 \cdot I^{\prime\prime}e$	$\frac{12 \cdot I''e}{3, 1} = 3, 9 \cdot I''e$	
	Breaking capacity	10 x I <sub>e</sub> (utilization category AC -4)	1,0	$\frac{10 \cdot I''e}{2, 5} = 4, 0 \cdot I''e$	$\frac{10 \cdot I''e}{3, 1} = 3, 2 \cdot I''e$	

Table 3-31: Parallel links making and breaking capacity

1) Voltage at each clearance between open contacts:

$$U = \frac{Ue}{\sqrt{3}}$$

#### Variants

The following variants of parallel connections are available:

Frame size Variants	
S00 to S3	3-pole, without terminal (star-point link) <sup>2)</sup>
S00 to S3	3-pole with terminal
S00	4-pole with terminal

Table 3-32: Parallel connections Variants

2) Accessories for star-delta combinations

Installation The parallel connections can be each shortened by one pole.

#### 3.4.7.6 Covers for frame sizes S2 and S3

To increase safety, terminal covers are available for contactors of frame sizes S2 and S3:

Variants	Function	Number required
Terminal cover for box terminals 3RT19.6-4EA2	Offers additional shock protection	2 covers per contactor are required (for the upper and lower main terminals)
Terminal cover for lug and bar connection 3RT1946-4EA1	Ensures that voltage intervals are adhered to Provides shock protection when the box termi- nal is removed	

Table 3-33: Covers

#### Installation

The following diagrams show you how to mount the covers:

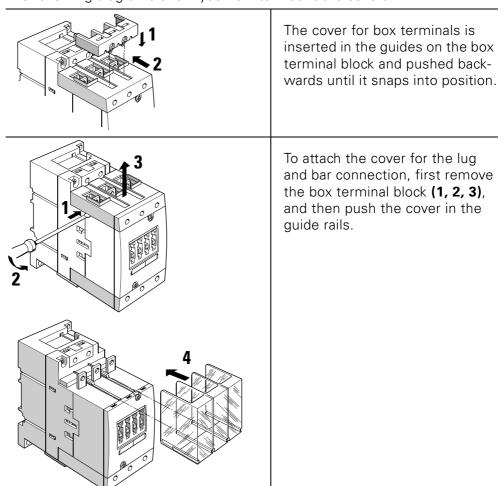

Figure 3-66: Terminal covers

### 3.5 Mounting and connection

#### 3.5.1 Mounting

Note

Note the following when mounting the cover:

- If foreign bodies, such as wood shavings, can get into the device, the contactors must be covered during installation.
- If there is a danger that dirt or dust could be present, or if there is a corrosive atmosphere, the contactors must be installed in a housing.
- Dust deposits must be vacuum cleaned.

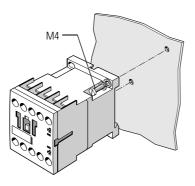

Attachment options

The attachment options for the contactors are uniform.

Frame size	Installation	Removal
S00 to S3	Screw-on attachment	Removed with a screwdriver
S00, S0	Snapped onto a 35 mm rail (in acc. with EN 50 022)	Removed without a tool
S2, S3	Snapped onto a 35 mm rail (in acc. with EN 50 022)	The snap-on spring can be opened with a screwdriver
S3	Snapped onto a 75 mm rail	Screwurver

Table 3-34: Attachment

#### Screw-on attachment

The 3RT1 contactors can be screwed onto a flat surface.

- With 2 M4 screws, diagonal
- Maximum tightening torque 2 Nm
- Washers and spring lock washers must always be used
- The distance to grounded parts at the side must be more than 6 mm

Figure 3-67: 3RT: Screw-on attachment (frame size S00)

# Snap-on attachment on rails

Snap-on attachment is possible:

- Frame sizes S00 to S3: on 35 mm rail
- Frame size S3: on 75 mm rail. The height of the rail must be at least 15 mm.

The following illustration shows you how to mount the device onto the rail:

The following indstration shows you h	
Frame sizes S00 and S0	
	Place the device on the upper edge of the rail, and press it downward until it snaps onto the lower edge of the rail <b>(1)</b> .
	Push the device downward to release the tension of the mounting spring, and remove the device by tilting it <b>(2)</b> .
Frame sizes S2 and S3	
	Place the device on the upper edge of the rail, <b>(1)</b> and press it down- ward toward the rail until it snaps onto the lower edge of the rail <b>(2)</b> . Using a screwdriver, push the lug on the lower rear side of the device
	downward to release the tension of the mounting spring (3), and remove the device by tilting it (4).

Figure 3-68: Snap-on attachment

#### Installation positions

The contactors are designed for use on vertical surfaces. The following installation positions are permissible for AC and DC operation:

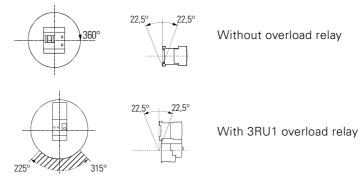

Figure 3-69: Installation positions

SIRIUS System Manual GWA 4NEB 430 0999-02b

No.	Size	AC/DC	Output power	Measure
1	S00 coupler 3RT10 1.	DC	3 to 5.5 kW	Without restriction
1	S00 coupler 3RH11	DC	I <sub>e</sub> /AC-15 6 A/230 V	With 2 NO + 2 NC contacts: stronger springs, otherwise no restriction
2	S00 3RT10 1.	DC	3 to 5.5 kW	Without restriction
2	S00 3RH11	DC	l <sub>e</sub> /AC-15 6 A/230 V	Without restriction
3	S00	AC	3 to 5.5 kW/ and I <sub>e</sub> /AC-15 6 A/230 V	Special variant
4	S0 coupler	DC	5.5 to 11 kW	Special variant
5	SO	DC	4 to 11 kW	Special variant
6	SO	AC	4 to 11 kW	Without restriction
8	S2	AC	15 to 22 kW	Special variant
9	S2	DC	15 to 22 kW	Vertical installation position no possible.
10	S3	AC	30 to 45 kW	Special variant
11	S3	DC	30 to 45 kW	Vertical installation position no possible.

# Vertical installation position

Table 3-35: Vertical installation position

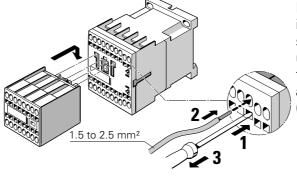

Motor and auxiliary contacts (including the contactor relay variants) are included in frame size S00.

#### 3.5.2 Connection

The SIRIUS contactors are available with the following terminal types:

- Frame sizes S00 to S3: screw-type terminals
- Contactors and auxiliary contactors of frame size S00: All the terminals are also available as Cage Clamp terminals
- Contactors of frame sizes S0 to S3: The auxiliary switches and coil connections are also available with Cage Clamp terminals.
- Accessories: screw-type and (for most of the range) Cage Clamp terminals
- The contactors of frame size S3 have removable box terminals for the main conductor terminals. This enables the connection of ring lugs or busbars.

Screw-type terminals	<ul> <li>The devices with screw-type terminals have the following features:</li> <li>All the connections have captive screws.</li> <li>All the terminal points are delivered in the open position.</li> <li>The screwdriver guides allow screwdriving machines to be used.</li> <li>In frame size S00, all the terminal screws for the main and auxiliary circuits have a uniform screw size (cross-tip Pozidriv 2 screws) and therefore all require the same torque.</li> <li>In all the frame sizes (S00 to S3), the terminal screws are identical for the auxiliary conductor terminals (no bit change and uniform torque).</li> </ul>
Cage Clamp terminals	<ul> <li>In the variant with Cage Clamp terminals, the devices have the following features:</li> <li>The contactors are recommended if strong shaking or vibrations can be expected at the installation location.</li> <li>The terminals are also suitable for two-conductor connections</li> <li>All the terminals are accessible from the front and are easily visible.</li> <li>A maximum of two conductors with a cross-section of 0.25 mm<sup>2</sup> up to a maximum 2.5 mm<sup>2</sup> can be used for each terminal point.</li> </ul>
Cage Clamp terminals: Procedure	The following illustration shows you how to use the Cage Clamp terminals: $$
Toocuure	Insert the screwdriver straight into the opening up until the

Insert the screwdriver straight into the opening up until the stop (1) to open the clamping unit. Insert the conductor in the oval terminal opening (2), and remove the screwdriver (3).

Figure 3-70: Cage Clamp terminals

#### Insulation stop

With a conductor cross-section of  $\leq 1 \text{ mm}^2$ , an insulation stop (3RT1916-4JA02) must be used to hold the conductor insulation securely. An insulation stop line consists of 5 pairs of connection terminals. The following illustration demonstrates insertion into the Cage Clamp infeeds.

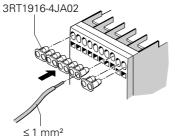

Figure 3-71: Insulation stop with Cage Clamp terminals

#### **Two-conductor connection** It is possible with all the main, auxiliary, and control cable connections to connect two conductor ends. They can also be used to connect untreated conductors with different cross-sections. Box terminals each with 2 terminal points are provided for the main conductor connection in contactors of frame sizes S2 and S3.

This connection method also promises problem-free looping and parallel connection without intermediate terminals.

Table 3-36: Conductor cross-sections (frame sizes S00 to S3)

#### 3.5.3 Changing the magnet coils

4 coil terminals

Contactors of frame sizes S0 to S3 have 4 coil terminals.

The advantages of this are as follows:

- Variable connection, depending on the amount of space and cable routing
- Easier wiring of feeders

The connection options are:

- From above with in fuseless configuration with circuit breakers connected above
- From below when fuses are used with an overload relay attached directly below
- Diagonal

Changing the magnetThe magnet coils can be replaced in the case of contactors of frame sizescoilsS0 to S3.

S0 - AC operation

The following illustration shows the replacement of the magnet coil in frame size S0 in AC operation:

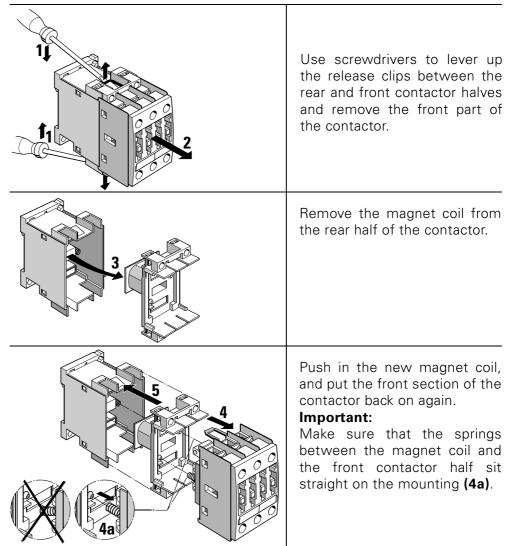

Figure 3-72: Replacing the magnet coil (frame size S0/AC)

#### S2 - AC operation

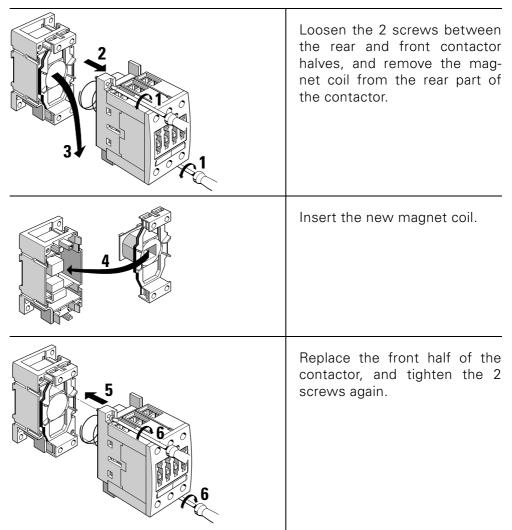

Figure 3-73: Replacing the magnet coil (frame size S2/AC)

### S2 - DC operation

Loosen the 2 screws between the rear and front contactor halves. Loosen the two screws on the plates that attach the magnet coil to the armature, and remove the magnet coil from the rear half of the con- tactor.
Insert the new magnet coil, and screw on the two plates again with the two screws.
Replace the front half of the contactor, and tighten the 2 screws again. Make sure the springs are in their correct position.

Figure 3-74: Replacing the magnet coil (frame size S2/DC)

#### S3 - AC operation

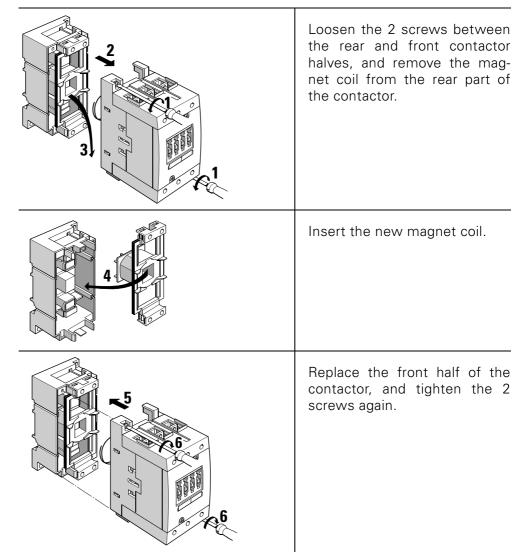

Figure 3-75: Replacing the magnet coil (frame size S3/AC)

#### S3 - DC operation

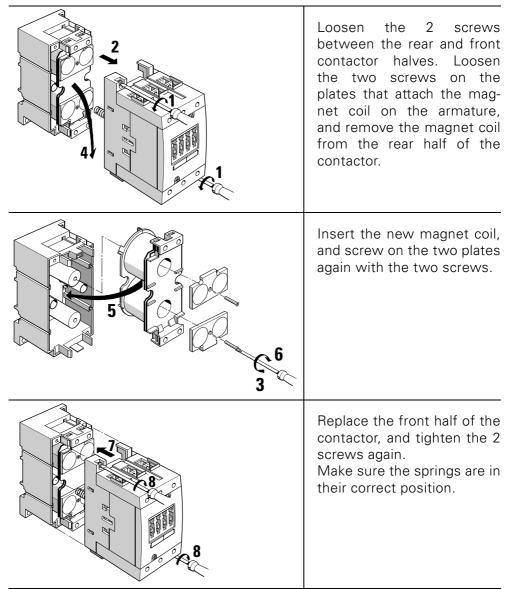

Figure 3-76: Replacing the magnet coil (frame size S3/DC)

#### 3.5.4 Changing the contact piece

The contact pieces can be replaced in contactors of frame sizes S2 to S3. When they are replaced for the third time, the arcing chamber also has to be replaced.

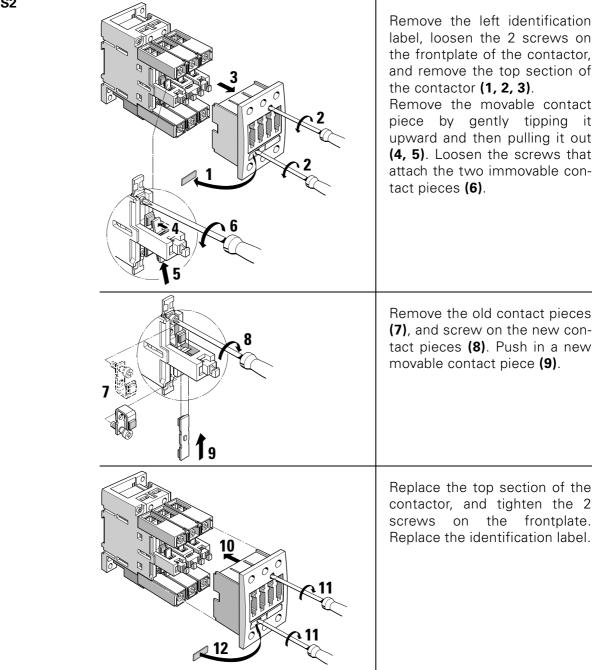

Figure 3-77: Replacing the contact piece (frame size S2)

# 3RT15 contactors, 4-pole (2 NO contacts + 2 NC main contacts)

1) With AC drive: 25 A DC drive: 20 A.

2) At  $U_s > 24$  V the rated operational currents  $I_e$  for the conducting paths of the NC contacts are 50% of the values for the conducting paths of the NO contacts.

# **3RT16** capacitor-switching contactors

The technical specifications for frame size S0 correspond, unless listed below, to those of the 3RT10 26 contactors, for frame size 2 to those of the 3RT10 36 contactors, and for frame size S3 to those of the 3RT10 45 contactors.

Contactor	Frame size Type		S0 3RT16 26	S2 3RT16 36	S3 3RT16 46

 Corresponds to IEC 60 947-4 (VDE 0660 Part 102): Coordination type "1": The destruction of the contactor and the overload relay is permissible. The contactor and/or overload relay must be replaced, if necessary. Coordination type "2":

The overload relay must not be damaged. Contact welding on the contactor is permissible, if it can easily be separated again from the contactor. 2) Up to  $l_k \leq 0.5$  kA;  $\leq 260$  V.

# 4.1 Specifications/regulations/approvals

Standards

• The 3RU11 thermal overload relays and the 3RB10 and 3RB12 electronic overload relays comply with the following standards: IEC 60947-1/DIN VDE 0660 Part 100 IEC 60947-4-1/DIN VDE 0660 Part 102 IEC 60947-5-1/DIN VDE 0660 Part 200 IEC 60801-2, -3, -4, -5; UL 508/CSA C 22.2.

• The 3RB10 and 3RB12 electronic overload relays also comply with the EMC standards.

**Tripping classes** The tripping classes describe time intervals within which the overload relays have to trip from a cold state with 7.2 times the set current in the case of a symmetrical, three-pole load. You will find the tripping classes in which the 3RU11, 3RB10, and 3RB12 overload relays are available in Section 4.2. The following table indicates the tripping classes and tripping times in acc. with the IEC 60947-4-1 standard:

Tripping class	Tripping time t <sub>A</sub> in sec at 7.2 x I <sub>e</sub> from a cold state
10A 10 20 30	$\begin{array}{l} 2 < T_A \leq 10 \\ 4 < T_A \leq 10 \\ 6 < T_A \leq 20 \\ 9 < T_A \leq 30 \end{array}$

Table 4-1: Tripping classes/tripping times

### **Time-delayed overload** release

The following table contains the operating limits of time-delayed overload releases in the case of an all-pole load:

Overload	Multiple of t	Reference			
release type	A	В	С	D	ambient tem- perature
Ambient tem- perature-com- pensated	1.05	1.2	1.5	7.2	+ 20 °C
	Not tripped < 2 h	Tripped < 2 h	Tripped < 4 min	Tripped from a cold state in 4 to 10 sec.	
			CLASS 10		
	< 2 h	< 2 h	< 8 min	6 to 20 sec	
			CLASS 20		

Table 4-2: Operating limits of time-delayed overload releases in the case of an all-pole load

The 3RU11, 3RB10, and 3RB12 overload relays are climate-proof in acc. with **Resistance to extreme** IEC 721.

> The 3RU11, 3RB10, and 3RB12 overload relays are shockproof in acc. with DIN VDE 0106 Part 100.

Depending on assignment to other devices, extended terminal covers are to be attached to the connecting bars.

	In the case of tripping devices with DC operation, electrical isolation must be secured by means of a battery network or a safety transformer in compli- ance with DIN VDE 0551.

When the 3RB12..-...1 electronic overload relays (no change to the switching state of the auxiliary contact elements in the event of the failure of the control supply voltage) are used to protect EEx d and EEx e motors, separate monitoring of the control supply voltage is recommended.

# 4.2 Device description

Overload relays are used to protect electrical equipment such as threephase induction motors and transformers from overheating. Overheating can be caused by overload, asymmetric current consumption, loss of a phase in the main supply conductor, or a blocked rotor.

Models

### There are 3 overload relay models available:

### • 3RU11 thermal overload relays

The 3RU11 thermal overload relays up to 100 A are designed for the current-dependent protection of loads with normal starting (tripping class 10) against impermissible overheating.

Impermissible overheating as a result of the above-mentioned causes leads to an increase in the motor current beyond the set rated current for the motor. This increase in current heats up the bimetal strips inside the device by means of heating elements. The strips are deflected and operate the auxiliary contact elements by means of a tripping mechanism. The auxiliary contact elements switch the load off by means of a contactor.

### • 3RB10 electronic overload relays

The 3RB10 self-supplying electronic overload relays up to 100 A are designed for the current-dependent protection of loads with normal and heavy starting (tripping classes 10 and 20) against impermissible overheating. Impermissible overheating as a result of the above-mentioned causes leads to an increase in the motor current beyond the set rated current for the motor. This increase in current is detected by the current transformers integrated in the devices and evaluated by an appropriate electronic circuit, which then sends a pulse to the auxiliary contact elements. These switch the load off by means of a contactor.

### 3RB12 electronic overload relays

The 3RB12 externally supplied electronic overload relays up to 820 A are designed for the current-dependent protection of loads with normal to heavy starting (tripping classes 5, 10, 15, 20, 25, and 30, which can be set on the device) against impermissible overheating. Impermissible overheating as a result of the above-mentioned causes leads to an increase in the motor current beyond the set rated current for the motor. This increase in current is detected by the current transformers integrated in the devices and evaluated by an appropriate electronic circuit, which then sends a pulse to the auxiliary contact elements. These switch the load off by means of a contactor. In addition to the current-dependent protection of the loads against impermissible overheating, the 3RB12 electronic overload relay allows the temperature of the motor winding to be monitored by connecting a PTC thermistor detector circuit in order to protect the load against overtemperature. This can be caused indirectly, for example, if the flow of the coolant is hindered and cannot be detected.

# 4.2.1 Overload relays in motor feeders

	There are two categories of motor feeder:		
Fuseless motor feeders	Fuseless motor feeders consist of combinations of circuit breakers for motor protection and contactors. These combinations are described in Chapter 5, "3RA1 fuseless load feeders".		
Fused motor feeders	Fused motor feeders consist of combinations of contactors and overload relays, often referred to as starter combinations, with upstream short-circuit protection (e.g. fuses, circuit breakers for starter protection).		
	<ul> <li>The advantages of fused motor feeders are as follows:</li> <li>It is easy to distinguish between tripping caused by an overload and tripping caused by a short circuit. In the event of a short circuit, the fuses limit the short-circuit current; in the event of an overload, the overload relay switches off the contactor and thus the motor.</li> <li>At voltages &gt; 400 V, fuses have a short-circuit breaking capacity of up to 100 kA. As a result, in 690 V systems, in particular, fused motor feeders are often preferred.</li> <li>If automatic RESET is set, the overload relay resets itself automatically and does not have to be switched on again locally.</li> <li>A remote reset can be implemented very easily by means of attachable electrical and mechanical RESET modules for the 3RU11 and 3RB10 overload relays. The electrical remote RESET is already integrated in the 3RB12 multifunctional devices.</li> <li>Group fusing can be used with a circuit breaker to protect several motor feeders against short circuit simultaneously, which has a positive effect on the costs of a single feeder.</li> <li>If there are already outgoing feeders that are protected against short circuits in the cubicle, additional short-circuit protection is often unnecessary.</li> <li>Combinations of a circuit breaker for starter protection, a contactor, and an overload relay also have the advantage that the feeder can be easily isolated and that, in the event of a short circuit, it is disconnected in three poles. 3RV13 circuit breakers for started combinations. These circuit breakers do not have any overload releases.</li> </ul>		

### 4.2.2 General device description

The 3RU11 and 3RB10 overload relays are electrically and mechanically compatible with the 3RT10 contactors and 3RW30/31 soft starters in the corresponding frame size.

### Frame sizes

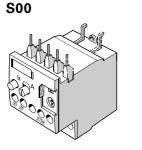

The 3RU11 thermal overload relays and the 3RB10 electronic overload relays are available in 4 frame sizes:

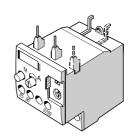

- Frame size S00: width 45 mm; up to 12 A
- Frame size S0: width 45 mm; up to 25 A
- Frame size S2: width 55 mm; up to 50 A
- Frame size S3: width 70 mm; up to 100 A

The 3RB12 electronic overload relay is available with the following dimensions:

- 3RB12 46: width 70 mm; up to 100 A
- 3RB12 53: width 120 mm; up to 205 A
- 3RB12 57: width 145 mm; up to 500 A
- 3RB12 62: width 230 mm; up to 820 A

### Fuses

The maximum permissible fuse values for overload relays are dependent on:

- The selected setting range (the smaller the setting range, the lower the fuse value).
- The maximum permissible fusing of the contactor or other devices in the circuit (e.g. soft starter or even the motor supply lead).

In the case of fuse values in acc. with coordination type 2, the contactor and overload relay can be reused after a short circuit.

The type plates on the devices provide information on the permissible fuse values. In addition, you will find detailed information in part 4 of the low-voltage switching technology (NSK) catalog.

# Starter protectionThe operating current of the instantaneous short-circuit release should be<br/>12 times the value of the rated motor current (the current set on the over-<br/>load relay). The corresponding 3RV13 starter circuit breakers can be<br/>selected from part 2 of the low-voltage switching technology (NSK) catalog.

Heavy starting	Heavy starting is when the motor requires longer than 10 seconds to reach the nominal speed. Given such long starting times, the switching devices and capacities have to be configured appropriately because the thermal load increases. The permissible AC-3 currents of motor contactors only take into account 10-second starts. In the case of longer starting times, derating must be carried out or a larger contactor used. You can determine the corre- sponding configuration on the basis of the tables of different starting times and motor currents in part 4 of the low-voltage switching technology (NSK) catalog.
Setting ranges with thermal overload relays	The setting ranges can be used up to the maximum value when there are temperatures of up to 60 °C inside the cubicle. At temperatures of 60 °C to 70 °C, derating is required. In other words, the maximum permissible set

- 70 °C, derating is required. In other words, the maximum permissible set value must be reduced. The reduction at 70 °C is 13 % and thus so negligible that due to the overlapping of the different current setting ranges no gaps occur between the setting ranges. A uniform current range of 0.11 to 87 A can thus also be used at 70 °C.
- **Overload relays in stardelta combinations** When overload relays are used in star-delta combinations, it must be taken into consideration that only  $1/\sqrt{3}$  of the motor current flows through the line contactor. An overload relay built onto the line contactor must be set to this level (i.e. 0.58 of the motor current). A second overload relay must be built onto the star contactor if your load is to receive optimal protection in star operation as well. The star current is 1/3 of the rated current of the motor. The corresponding overload relay must be set to this current. The 3RB12 electronic overload relays with internal ground fault detection are not suitable for use in star-delta combinations, since transient current spikes occur at switchover from star to delta operation. These can result in the triggering of ground fault detection.

### 3RU11 thermal overload relays

Description

- Tripping class 10
- For motor currents of up to 100 A
- For three-phase, single-phase, or DC motors
- Insensitive to "untidy" power systems

Thermal, time-delayed overload relays are the usual way of providing motor protection with overload relays. The technology has been tried and tested and continuously improved over a period of decades. They are reasonably priced and provide reliable protection, particularly in the case of normal starting times (class 10) and motor ratings of up to 45 kW (100 A). Thermal overload relays work with bimetals and heater coils through which the motor current flows. Thermal overload relays record true root-mean-square values and direct currents as a result of their current measuring method (Joule heat). Compatible heating coils and bimetals are used for the different setting ranges. Single-phase and direct-current motors can also be protected against overload by looping the motor line. Thermally time-delayed overload relays can also be used after frequency converters.

### **3RB10 electronic overload relays**

### Description

- Tripping classes 10 and 20
- For motor currents of up to 100 A
- Low waste heat, energy-saving
- Wide setting ranges for simple configuration, selection, and less storage
- Extremely low energy requirements: approx. 50 mW

Electronic overload relays work with current transformers that provide a measurement signal that is evaluated by an electronic circuit. They are designed for sinusoidal 50/60 Hz supply voltages.

The 3RB10 electronic overload relay, like the 3RU11 thermal overload relay, can be built directly into the motor feeder but hardly causes any heat loss thanks to the electronic measurement system. The tripping classes 10 (for normal starting) and 20 (for heavy starting) are implemented with the 3RB10 electronic overload relay.

The current range of the electronic overload relays can be set to the motor current at a ratio of 1:4 (lower to upper current mark). Up to 6 motor ratings are covered by a single range, and a current range of 0.1 to 100 A is covered by only 7 setting ranges.

### 3RB12 electronic overload relays

### Description

The 3RB12 electronic overload relays are suitable when there are high motor protection requirements on account of the following features:

- Tripping classes 5/10/15/20/25/30 settable
- For motor currents of up to 820 A
- Evaluation of PTC thermistors
- Analog output signal of 4 mA to 20 mA for current detection (insensitive to harmonics)
- High accuracy of the tripping characteristic with a tolerance of  $< \pm 10$  %
- Ground fault detection internally and externally through summation current transformer
- Insensitive to external influences such as vibrations, different cable crosssections, temperature fluctuations, corrosive environments or aging

The 3RB12 electronic overload relay can be used for everything from easy starting (CLASS 5) to very heavy starting (CLASS 30). The tripping class can be set in steps to the relevant motor starting time. In addition, the 3RB12 is equipped with inputs for PTC thermistors, which make it a fully protected motor device. Additional functions such as ground fault detection and an analog output signal are also possible. It is available in 4 sizes from 1.25 to 820 A.

It is triggered in the event of an overload, current imbalance, phase loss, or a blocked rotor.

### 4.2.3 Operation

**Short-circuit protection** For short-circuit protection of starter combinations consisting of a contactor and an overload relay, fuses or 3RV13 circuit breakers are required for starter combinations.

Use with external current transformers If external current transformers are to be used to operate the 3RB12, the following things should be taken into consideration. The 3RB12 with the current setting range from 1.25 to 6.3 A must be selected. The secondary current of the 1 A or 5 A current transformer becomes the primary current of the 3RB12. In the case of 5 A current transformers, the 3RB12 can be set from 1.25 to 5 A (i.e. from 1/4 of to 1 times the transformer's rated current). In the case of 1 A current transformers, a signal > 1.25 A must be generated by looping the line. If the line is looped five times, a 5 A signal is generated for the 3RB12.

### Environmental conditi- 3RU11

ons

The 3RU11 overload relays can be used without restrictions at ambient temperatures of up to 60 °C. This is the result of new bimetals and continuous temperature compensation (up to 70 °C with derating).

### 3RB10

A special coating on the PCB and the electronic components ensures reliable operation even in corrosive and tropical environmental conditions.

Auxiliary contact elementsThe 3RU11 and 3RB10 overload relays are equipped with a normally closed<br/>contact for switching off the contactor and a normally open contact for the<br/>tripped signal.<br/>The switching contacts have a high switching capacity so that they can<br/>switch contactor coils directly. The overload relays are therefore suitable for<br/>use with a PLC (17 V, 5 mA).

### Frame size S00

switch repetition termi-<br/>nalIn the case of direct mounting onto contactors, the auxiliary switch and coil<br/>repeat terminals (A2) are passed through the 3RU1116 and 3RB1016 over-<br/>load relays. This makes wiring much simpler.

### Frame sizes S0 - S3

The contactors of these frame sizes are equipped with 4 coil connections. It is therefore not necessary to pass through the auxiliary switch and coil terminals (A2) of the contactor.

**Coil and auxiliary** 

Tripping classes	<b>3RU11</b> The 3RU11 thermal overload relays are available for normal starting in trip- ping class 10.
	<ul> <li><b>3RB10</b></li> <li>The 3RB10 electronic overload relays are available in 2 tripping classes:</li> <li>Tripping class 10 for normal starting</li> <li>Tripping class 20 for heavy starting</li> <li><b>3RB12</b></li> <li>The 3RB12 electronic overload relays can be set to different tripping classes (5/10/15/20/25/30) on the device.</li> </ul>
Phase loss sensitivity	The 3RU11/3RB10/3RB12 overload relays are sensitive to phase imbalance.
	<b>Note on explosion protection</b> For releases and relays with current-sensitive delayed tripping, tripping cha- racteristics must be available at the installation location. ## 4.3 Application and use

#### 4.3.1 3RU11 thermal overload relay and 3RB10 electronic overload relay

**3RB10** The 3RB10 electronic overload relays are developed for use in sinusoidal 50/ 60 Hz voltage networks. No additional supply voltage is required for operation. The current transformers are integrated in the devices for the purpose of current detection. An ASIC checks the current values of each phase and causes tripping in the event of an overload or phase loss.

3RU11

3RU11 front view:

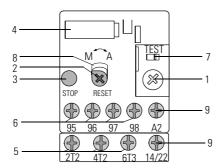

Figure 4-4: 3RU11 front view

1 2

Functions

- Scale for setting the load rated current Reset button (blue): Press the RESET button to get the relay ready before putting it into operation or after tripping.
- 3 Stop button (red):

The stop button opens the normally closed contact, which remains open until the button is released again. The downstream contactor and thus the motor can be switched off.

Press the STOP button to switch the relay off when it is in operation. The normally closed contact of the auxiliary switch opens. The relay remains ready for operation.

- 4 Device type plate
- 5 Terminals for three motor supply lines
- 6 Terminals for normally closed/normally open contacts (95/96 for normally closed contacts, 97/98 for normally open contacts)
- 7 Contact position indicator/test The slider for the contact position indicator also serves as a test function. When it is operated, tripping of the overload relay is simulated. The normally closed contact (95/96) opens, and the normally open contact (97/98) closes. The switching position is indicated.
- 8 Switch for manual/auto RESET: By pressing and turning the blue button you can select automatic or manual reset. In the case of the relay setting M (manual reset), the switching position of the relay is indicated: I = ready for operation
  - O = tripped
- 9 Only in the case of frame size S00: Terminal A2: repetition terminal of the contactor coil Terminal 14/22: repetition terminal of the contactor auxiliary switch

## **Auxiliary contacts** The following table shows the behavior of the auxiliary contacts when the TEST/STOP and RESET buttons are pressed:

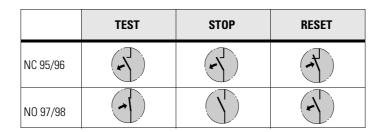

Table 4-5: 3RU11/3RB10 auxiliary contacts

Setting the rated current The following figure shows how the rated current is set, using the example of the 3RU11, frame size S00.

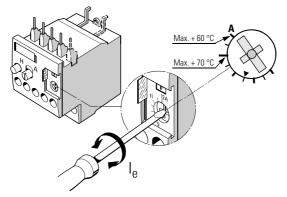

Figure 4-5: Setting the rated current

#### Important

When the sealing cover (transparent sliding window) is closed (3RU11) or mounted (3RB10), it is not possible to use the blue reset button for a switchover between M (manual reset) and A (automatic reset).

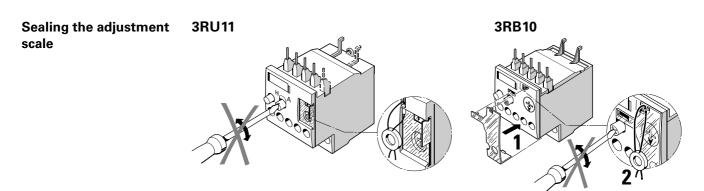

Figure 4-6: Sealing the adjustment scale (frame size S00)

#### **Recovery time**

	3RU11	3RB10
Automatic reset	3 to 5 min <sup>1)</sup>	4 min
Manual reset	3 to 5 min <sup>1)</sup>	Immediate

Table 4-6: Recovery time

1) Dependent on the setting range

The following figure shows how to switch between manual and automatic for the 3RU11 and 3R10 using the example of the 3RU11, frame size S00:

#### **Manual-automatic**

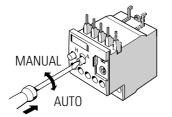

Figure 4-7: Manual/automatic switchover

#### Resetting

The 3RU11 thermal overload relay can also be reset manually after the bimetals have cooled down (after approx. 3 to 5 minutes), or it can reset itself automatically after this time when the AUTO position is set. The 3RB10 electronic overload relay can be reset at any time by pressing the RESET button. The recovery time for the automatic reset is 4 minutes.

#### 3RU11

set current.

# **Tripping characteristics** The time-current characteristics show the dependency of the tripping time from a cold state on the multiple of the set current $l_e$ . When the relay is at operating temperature, preloaded with $1 \times l_e$ , the tripping times are reduced to around 25 %. In the case of a single-pole load, the tripping characteristics lie between the characteristics. In normal operation, all three bimetal strips of the overload relay must be heated. The 3RU overload relays are suitable for protecting motors with phase control. To protect single-phase or direct current loads, all three main conducting paths must be connected in series. The minimum tripping current in the case of a three-pole symmetric load lies between 105 % and 120 % of the

- ② from a warm state

③ in the event of phase loss or current imbalance (the phase loss protection function triggers the overload relay after 3 seconds)

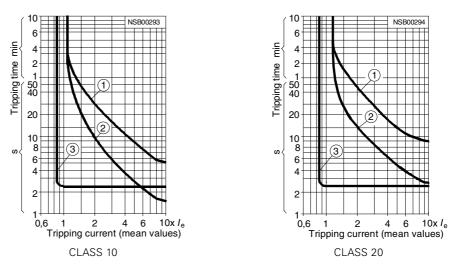

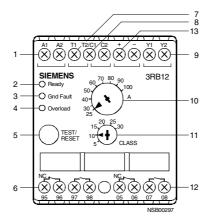

Figure 4-9: Time-current characteristics for class 10 and class 20, chart for the 3RB10

#### 4.3.2 3RB12 electronic overload relays

3RB12 front view:

#### **Functions**

- 1 Terminals of the control supply voltage
- 2 Green "Ready" LED
- 3 Red "Ground Fault" LED
- 4 Red "Overload" LED
- 5 Combined test/reset button with function test
- 6 1 NO contact/1 NC contact for overload/thermistor tripping or
   1 NO contact/1 NC contact for overload/thermistor or ground fault tripping
- 7 Terminals for thermistor
- 8 Terminals for external summation current transformer
- 9 Terminals for remote or automatic reset
- 10 Rotary switch for current setting
- 11 Rotary switch for the class
- 12 1 NO contact/1 NC contact for ground fault tripping or 1 NO contact/1 NC contact for overload warning

Overload	In the event of an overload > 110 % of the current $l_e$ set using the rotary switch on the front of the device, of current imbalance of 40 % $l_e$ , or of phase loss, tripping occurs through the switchover of two auxiliary contact elements (1 NO contact: 97/98 / 1 NC contact: 95/96) after the tripping time set by means of the six-step rotary switch (CLASS 5/10/15/20/25/30). After overload tripping, the overload relay can be reset either by pressing the test/reset button on the device or by remote or automatic reset after the recovery time of 5 minutes elapses.
Thermistor detector	A tripping operation as a result of the thermistor detector responding takes

place via the same auxiliary contact elements as for overload tripping (1 NO contact: 97/98 / 1 NC contact: 95/96), except that it is instantaneous.

The overload relay cannot be reset until the temperature in the motor winding 5 K has sunk to under the operating temperature of the thermistor.

Ground fault	In the event of a ground fault, the device trips instantaneously; depending on the device variant, this may occur via a separate output (1 NO contact/1 NC contact).		
Remote/automatic reset	Remote or automatic resetting can be implemented by means of external wiring (Y1-Y2 terminals).		
	<b>Important</b> In the case of ground fault	tripping, an automatic res	et is not possible.
Test	The device functions of cur input and the tripping func tested by pressing the tes The device functions can a the status.	tions of the auxiliary conta t/reset button.	ct elements can be
Internal failure	Self-monitoring causes the this case, the overload rela	•	t of an internal fault. In
Failure of the control supply voltage	In the event of the failure of the control supply voltage for any length of time (> 0.2 seconds), the output relays respond in either a monostable or bistable manner, depending on the variant involved. The following table shows the behavior of the output relays in the event of the failure of the control supply voltage:		
	Behavior of the <b>output</b> relays given:	Monostable 3RB120	Bistable 3RB121
	Failure of the control supply voltage	Device trips	No change to the switching status of
	Return of the control supply voltage without prior tripping	Device resets	the auxiliary contact elements
	Return of the control supply voltage after prior tripping	Device remains tripped Reset at: - Overload tripping after 5 - Thermistor tripping whe operating temperature re - Ground fault tripping im	n 5 K under the ached

Table 4-7: Failure of the control supply voltage

#### **Tripping characteristics**

The time-current characteristic for three-pole symmetric loading shows the dependency of the tripping time from a cold state on the multiple of the set current.

When the overload relay is preloaded with 100 % of the set current, the tripping times are reduced.

In the case of two-pole loading (loss of a phase) or current imbalance

> 40 % of the set current, the corresponding characteristic applies.

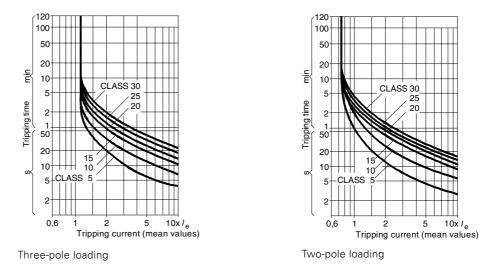

Figure 4-11: Time-current characteristics, chart for the 3RB12

#### 3RB12 electronic overload relay with analog output

**Field of application** 

The electronic overload relay with analog output is used for measuring instruments and analog modules with 4 to 20 mA input.

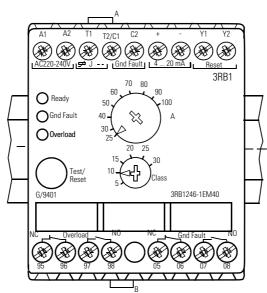

Figure 4-12: Electronic overload relay with analog output, front view

For automatic resetting, jumper B is attached between terminals Y1 and Y2.

#### Analog output

4 mA to 20 mA 1 % x  $I_e = 0.128$  mA

I/I<sub>e</sub> [%] = (I<sub>out</sub> - 4 mA) / 0.128 mA I<sub>Motor</sub> [A] = (I<sub>out</sub> - 4 mA) x I<sub>e</sub> /12.8 mA

I <sub>out</sub>	Output current of the analog output
I <sub>Motor</sub>	Motor current, max. phase
l <sub>e</sub>	Set current (rated current for motor)

l <sub>out</sub> [mA]	۱/۱ <sub>e</sub> [%]
0	No connection, wire break!
4.000	Device in operation
4.128	
5.280	0
7.200	1
10.40	10
15.52	25
16.80	50
18.08	90
20.00	100
	110
	125

Example:	$I_{out} = 10.40 \text{ mA}; I_e = 6.0 \text{ A}$
	l = 50% v. l <sub>e</sub>
	I <sub>Motor</sub> = 3 A

Technical specifications	Max. output current	23 mA
	Terminals	"+" and "-"
	Max. load	100 Ω
	Accuracy	+/- 10%
	Short circuit-proof and idling	J-proof

## 4.4 Accessories

#### 4.4.1 Electromechanical remote reset

The electromechanical remote reset is suitable as an accessory for the 3RU11 and 3RB10 overload relays in frame sizes S00 to S3. It is used to reset the overload relay from control rooms after overload tripping. The coil of the module is designed for an operation duration of 0.2 to

4 seconds. Maintained-contact control is not permissible.

**Installation/removal** The following figure shows how the electrical remote reset is installed and removed, using the example of the 3RU11 in frame size S00.

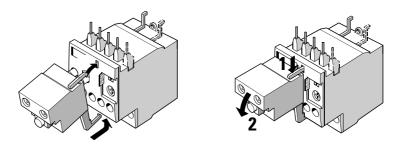

Figure 4-13: Electrical remote reset, installation/removal

Voltages	24 VDC to 30 VDC 50/60 Hz 110 VDC 127 VDC 50/60 Hz 220 VDC to 250 VDC 50/60 Hz
Operating range	The operating range of the coil is: 0.85 to 1.1 x ${\rm U}_{\rm S}$
Power consumption	The power consumption of the electromagnetic remote reset is: 80 VA AC, 70 W DC
Manual reset	A manual reset is possible by means of the blue repeat button on the remote reset module.
Connection cross-sec- tions	The values for the screw-type terminals of terminals E1 and E2 correspond to the cross-sections of the auxiliary connecting leads of the 3RU11/3RB10 overload relays.

#### 4.4.2 Mechanical remote reset

The mechanical remote reset is available in 2 variants:

- A resetting plunger with a support and funnel (3RU1900-1A) for operation from the cubicle door.
  - The plunger must be cut to the required length.
- A wire release with a support (3RU1900-1B, -1C) for built-in overload relays that are hard to reach. The wire is available in two lengths: 3RU1900-1B: 400 mm 3RU1900-1C: 600 mm

#### **Resetting plunger**

Installation

The following graphics show how to install and remove the resetting plunger or the wire release for the 3RU11, frame size S00.

Example 3RU11, frame size S00:

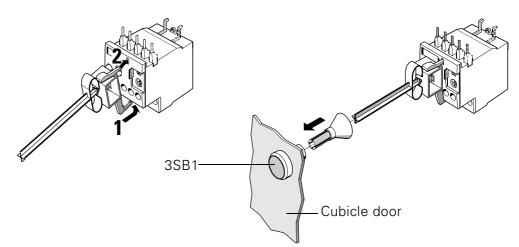

Figure 4-14: Mechanical remote reset: resetting plunger, installation

Removal

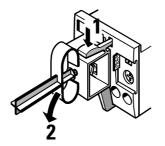

Figure 4-15: Mechanical remote reset: resetting plunger, removal

#### Wire release

Example 3RU11, frame size S00:

Installation

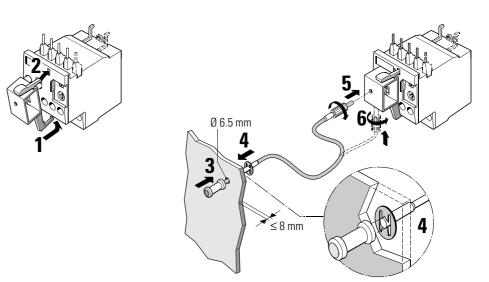

Figure 4-16: Mechanical remote reset: wire release, installation

Removal

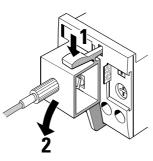

Figure 4-17: Mechanical remote reset: wire release, removal

Sealable coverA sealable cover is available as an accessory for the 3RB10 electronic over-<br/>load relay.<br/>In the case of the 3RU11 thermal overload relay, the cover is integrated in<br/>the device.

## 4.5 Mounting and connection

4.5.1 Mounting	
3RU11/3RB10	The 3RU11 and 3RB10 overload relays can be attached directly to the 3RT contactors and 3RW30/31 soft starters in the corresponding frame size. In stand-alone installation they are suitable for being snapped onto a 35 mm rail in acc. with DIN EN 50 022 or for screw-on mounting. The overload relay in the frame size S3 is suitable for 35 mm and 75 mm rails.
3RB12	<b>70 mm width</b> The 3RB12 electronic overload relays are either snapped onto a 35 mm rail in acc. with DIN EN 50 022 or screwed onto a mounting plate by means of push-in lugs, which are available as accessories. The devices with current setting ranges < 100 A are designed for stand- alone installation on account of the bar-type system of the primary current lines.
	<ul> <li>120 mm/145 mm/230 mm width</li> <li>In the case of the current setting ranges &gt; 50 A to 820 A of the device widths 120 mm, 145 mm, and 230 mm, the 3RB12 electronic overload relays can be mounted directly onto the contactors by means of connecting bars.</li> <li>A screw-on attachment is integrated in the housing of these devices.</li> <li>For the 3RB1253 devices (120 mm width) there is also a base plate available for snap-on attachment to a 75 mm rail.</li> </ul>
Mounting onto contac- tors/soft starters	The following illustration shows how overload relays (in this case the 3RU11) in frame size S00 are attached to the 3RT contactor and the 3RW30/31 soft starter:

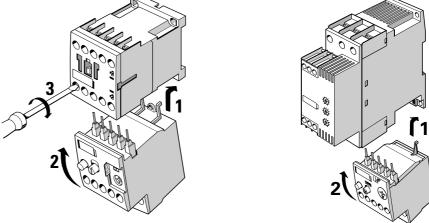

Figure 4-18: Mounting onto the 3RT contactor/3RW3 soft starter

Stand-alone installation The following illustrations show how the holder for stand-alone installation is mounted. **Frame size S00/S0**:

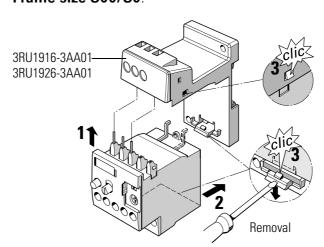

Figure 4-19: Stand-alone holder, example 3RU11 (frame size S00/S0)

#### Frame size S2/S3:

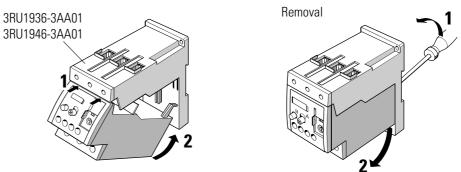

Figure 4-20: Stand-alone holder, example 3RU11 (frame size S2/S3)

#### **Snap-on mounting**

The 3RU11 and 3RB10 overload relays can either be mounted onto the contactor or snapped onto a 35 mm rail by means of the holder for stand-alone installation.

The frame size S3 can be snapped onto a 35 mm rail or a 75 mm rail.

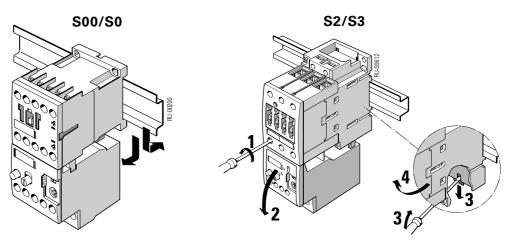

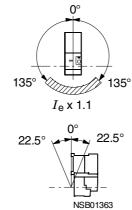

Figure 4-21: Snap-on mounting and removal with the 3RT contactor

Removing the device from the rail	<ul> <li>Contactor/overload relay combination</li> <li>S00/S0:</li> <li>Push the contactor downward, and swing it</li> <li>S2/S3:</li> <li>1 Remove the overload relay from the cor</li> <li>2 Use a screwdriver to release the snap-or</li> <li>(this is shown in Section 3.5 on the instators).</li> </ul>	ntactor. In mounting on the contactor
Screw-on mounting	<ul> <li>Overload relay with holder for stand-alon. The overload relay is screwed on by means of in the holder for stand-alone installation using torque of 1.5 to 2 Nm. The screws are secure washers.</li> <li>Contactor/overload relay combination <ol> <li>Mount the contactor on a flat surface w</li> <li>Mount the overload relay on the contactor</li> </ol> </li> </ul>	of 2 M4 screws in the openings ig the maximum tightening ed with washers and spring lock with 2 M4 screws.
Minimum clearance	Maintain a minimum clearance from grounded parts at the side of > 6.5 mm.	
Installation positions	<b>3RU11</b> The drawings below show the permissible installation positions for the 3RU11 overload relays for mounting on contactors and stand-alone installa- tion. If the installation position is in the shaded area, an adjustment of 10% must be made.Contactor + overload relayOverload relay in stand-alone installation	

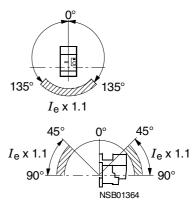

Figure 4-22: Permissible installation positions for the 3RU11

#### 3RB10/3RB12

Any installation position is possible for the 3RB10 and 3RB12.

4.5.2 Connection		
3RU11	<ul> <li>The 3RU11 overload relays are equipped with the following terminal system:</li> <li>S00 to S3: Screw-type terminal for the main and auxiliary connecting leads</li> <li>S00: Cage Clamp terminal for the main and auxiliary connecting leads (only stand-alone installation possible)</li> <li>S0 to S3: Screw-type terminal for main contacts and Cage Clamp terminal for auxiliary connecting leads (contactor mounting and stand-alone installation possible)</li> </ul>	
3RB10/3RB12	The 3RB10 and 3RB12 electronic overload relays have screw-type terminals. The 3RB1246 electronic overload relays are equipped with a bar-type trans- former.	
Bar-type system	<ul> <li>In the case of the 3RB1246 electronic overload relays with current setting ranges &lt; 100 A (70 mm width), the main lines are connected in a bar-type system. The main lines are connected through the current transformer integrated in the housing at rated currents for the motor of 1.25 A to 100 A. The advantages are:</li> <li>No additional installation costs</li> <li>No power loss at the transfer resistors of the clamping units that would otherwise be necessary</li> </ul>	
Looping through	At motor rated currents $I_N < 1.25$ A, the motor supply leads can be fed through the loop-through openings several times (n times) in each phase. The set current $I_e$ of the device is calculated as follows: $I_e = 3 \times I_N$ Example: $I_N = 0.5$ A n = 3 $I_e = 3 \times 0.5$ A = 1.5 A n = 5 is recommended as a good upper limit in practice. The following graphics illustrate the loop-through system:	

Figure 4-23: Loop-through system, 3RB1246

2

**Screw-type terminal** The screws are captive, and the screwdriver guides allow the use of power screwdrivers.

**Cage Clamp terminal** The following illustration shows a Cage Clamp terminal with the 3RU11, using the example of frame size S2:

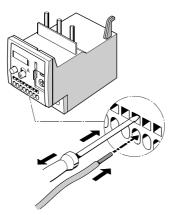

Figure 4-24: 3RU11: Cage Clamp terminal (frame size S2)

Conductors with a cross-section of 0.5  $\rm mm^2$  (with insulation stop) to 2.5  $\rm mm^2$  can be used.

**1.** Insert the screwdriver into the opening until the stop.

#### Note

The 8WA280 screwdriver is recommended for opening the Cage Clamp terminal.

The screwdriver head automatically keeps the clamp open.

#### Caution

When clamping and unclamping, the screwdriver must be inserted in the rectangular opening until the stop. You must not make any levering or turning movements, because these might break the cage clamp.

**2.** Insert the conductor in the oval terminal opening.

**3.** Remove the screwdriver.

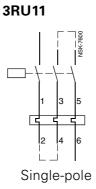

The terminal clamp closes, and the conductor is thus securely clamped.

Connection cross-sections You can obtain the permissible connection cross-sections for the main and auxiliary connections of the overload relays from Section 4.7, "Technical specifications".

#### Short-circuit protection with fuses for motor feeders with short-circuit currents of up to 50 kA at 690 VAC

1)

Please note the operating voltage. Assignment and short-circuit facilities in acc. with IEC 60 947-4-1/DIN VDE 660 Part 102 2)

Coordination type "1": Contactors or starters must not endanger people or the system in the event of a short circuit. They do not have to be suitable for further operation without repair and part replacement.

**Coordination type "2":** Contactors or starters must not endanger people or the system in the event of a short circuit and must be suitable for further use. There is a danger of contact welding.

3) Mounting on the contactor is possible after removal of the box terminal block.

#### 4.7.3 3RB12 electronic overload relays

Type			3RB12 46	3RB12 53	3RB12 57	3RB12 62
Width			70 mm	120 mm	145 mm	230 mm
General specifications Tripped at			Overlead phas	o loss phaso im	abalanco (> 10% i	n acc. with NEMA),
inphed at					thermistor motor	
Tripping class	In acc. with IEC 60 947-4-1	CLASS	5, 10, 15, 20, 2 switch	5, and 30; adjus	table by means o	f a 6-way rotary
Phase loss sensitivity			Yes			
Overload warning			Yes, as of 1.5 x asymmetric loa		netric load, and as	of 0.85 x <i>l</i> <sub>e</sub> given a
Resetting and recovery						
Resetting options after tripping			Manual, remote	e, and automatio	c resetting <sup>1</sup> )	
Recovery time	With automatic reset	min	When tripped to sinks under the	oy thermistor: tin operating temp		or temperature 5K
	With manual reset	min	When tripped to sinks under the		perature	ently) or temperature 5K
	With remote reset	min	When tripped to sinks under the		perature	ently) or temperature 5K
Configuration						
Indication of operating status on device			Yes, with 3 LED "Ground fault" L		y" LED, red "Over	oad" LED, and red
Test function			Yes, with comb	ined TEST/RES	ET button <sup>2</sup> )	
Reset button			Yes, with comb	ined TEST/RES	ET button <sup>2</sup> )	
Stop button				ined TEST/RES	ET button <sup>2</sup> )	
For the safe operation of motors with increased safety protection	EC special test certificate number in compliance with directive 94/9/EC		PTB 01 ATEX 3	220		
Ambient temperatures						
Storage/transportation		°C	-40 to +80			
Operation		°C	-25 to +70			
Temperature compensation		°C	Up to 70			
Permissible rated current at	Internal cubicle temperature of 60 °C	%	100 (current red	duction is not re	quired at above +	-60 °C)
	Internal cubicle temperature of 70 °C	%	100 (current red	duction is not re	quired at above +	-60 °C)
Repetition terminals						
Terminal for contactor coil			Not required			
Auxiliary switch repetition terminal			Not required			
Degree of protection	In acc. with IEC 60 529/DIN VDE 0470 Part 1			max. set current max. set current		
Shock protection	In acc. with DIN VDE 0106 Part 100		Protected against finger touch		ainst finger touch	with cover
Sinus shock resistance	In acc. with IEC 68 Part 2-27	<i>g</i> /ms	15/11			
EMC noise immunity						
Conducted disturbance neutralization - burst	In acc. with IEC 61 000-4-4: (corresponds to severity grade 3)	kV	2			
Conducted disturbance neutralization - surge	In acc. with IEC 61 000-4-5: (corresponds to severity grade 3)	kV	2			
Electrostatic discharge	In acc. with IEC 61 000-4-2: (corresponds to severity grade 3)	kV	8			
Field-related disturbance neutralization	In acc. with IEC 61 000-4-3: (corresponds to severity grade 3)	V/m	10			
EMC emitted interference			Limit value clas	s B in acc. with	EN 55 011	
Resistance to extreme climates (atmospheric humidity)		%	100			
Dimensions			See dimension	ed drawings		
Site altitude		m	Up to 2000 abo	ove sea level		
Construction type/mounting			Stand-alone installation <sup>3</sup> )	Direct mounti tional terminal		tallation without addi

1) Tripped at ground fault only in the case of devices with the order number suffi-xes 20 and 30 or in conjunction with the external summation current transformer accessories 2) For a detailed explanation, see "Description".

4) For screw-on attachment

# 5.1 Specifications/regulations/approvals

## **Coordination types**

	The fuseless load feeders are manufactured and tested in acc. with IEC 60947 Part 1 and Part 2. An important selection criterion for the fuseless load feeders are the coordination types. IEC 60947-4-1/DIN VDE 0660 Part 102 draws a distinction between two coordination types, known as coordination type 1 and coordination type 2. They describe what happens at a short circuit and the device status after a short circuit. In both coordination types, the short circuit to be dealt with is reliably disconnected. There must be no damage to systems or injury to persons. The differences lie only in the degree to which the device is damaged after the short circuit.
Coordination type 1	The fuseless load feeder can be inoperable after each short-circuit discon- nection. Damage to the contactor and the circuit breaker is permissible.
Coordination type 2	After a short-circuit disconnection, there must not be any damage to the overload release or any other part. The 3RA1 fuseless load feeder can be put into operation again without the need for replacement. Only welding of the contactor contacts is permissible if they can be separated easily without any significant deformation.
Approvals/test reports	All the approvals and test certificates of the individual devices used in the feeders are valid.

## 5.2 Device descriptions

Fuseless load feeders are combinations of devices consisting of a circuit breaker for overload and short-circuit protection and a contactor for normal switching duty.

The 3RA fuseless feeders of SIRIUS are used to switch loads of up to 100 A and protect them against overload and short circuits.

The feeders always consist of a SIRIUS 3R circuit breaker for motor protection (3RV) and a motor contactor (3RT).

The different devices can be set up separately and connected electrically by means of cables. It is simpler to connect the circuit breakers and contactors mechanically and electrically using ready-made kits.

The circuit breaker and contactor in the combination must be compatible with each other. It is not permissible to combine contactors and circuit breakers that are not compatible.

The combinations described below have been tested individually in order to verify that the specified performance data are correct.

The 3RV circuit breaker provides overload and short-circuit protection; upstream protective devices are not required for short-circuit currents of up to 50 kA / 400 V.

The 3RT contactor takes on the normal switching of loads.

Depending on which device combination is selected, coordination type "1" or "2" is reached.

Coordination type "2", which is the more stringent test, always includes coordination type "1".

The specifications apply to direct starters and reversing starters.

#### **Device variants**

The fuseless load feeders can be set up in 4 frame sizes:

- Frame size S00: width 45 mm; for three-phase induction motors up to 0.75 kW / 400 V, coordination type "2" and 5.5 kW / 400 V, coordination type "1"
- Frame size S0: width 45 mm; for three-phase induction motors up to 7.5 kW / 400 V, coordination type "2" and 11 kW / 400 V, coordination type "1"
- Frame size S2: width 55 mm; for three-phase induction motors up to 22 kW / 400 V, coordination type "2" and coordination type "1"
- Frame size S3: width 70 mm; for three-phase induction motors up to 45 kW / 400 V, coordination type "2" and coordination type "1"

#### 5.2.1 Mounting systems

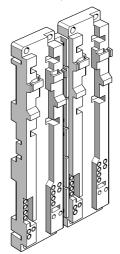

The possible types of mounting are as follows:

- On a 35 mm rail in acc. with DIN EN 50 022
- Screw-on attachment by means of the attachment openings integrated in the rail adapter
- On busbar systems with a busbar center-to-center clearance of 40 mm or 60 mm

The following illustrations show the adapters for rail and busbar mounting:

Rail adapter

Busbar adapter

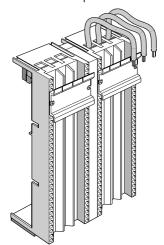

Figure 5-1: Rail adapter/busbar adapter

#### 5.2.2 Mounting kits for self-assembly

Because SIRIUS is a modular system, the standard devices fit together optimally both mechanically and electrically. The fuseless load feeders can therefore be assembled quickly and easily in all four frame sizes. To this end, the circuit breaker and the contactor are connected to the corresponding kit.

Kits

There are kits for reversing feeders for mounting on:

- Rail, frame sizes S0, S2, S3: mounting kit for reversing operation frame size S00: wiring kit for reversing operation
- Busbars, frame sizes S00, S0, S2: mounting kit for reversing operation

The following illustration shows how to assemble the fuseless load feeder of frame size S00 for reversing operation and rail mounting:

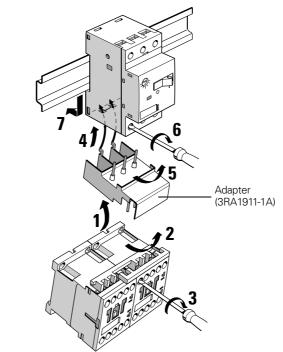

Figure 5-2: Self-assembly of a fuseless load feeder (frame size S00)

#### 5.2.3 Complete devices

The fuseless load feeders are also available fully assembled:

- Up to 22 kW in the case of direct starters
- Up to 11 kW in the case of reversing starters

Control supply voltage	For control voltages of: • 230 VAC / 50 Hz • 24 VDC
	Self-assembly on rails or busbar systems is recommended for other control voltages.
Auxiliary contact ele- ments	<ul> <li>Direct feeders The contactors of frame size S00 contain a free normally open contact</li> <li>Reversing feeders S00/S0: electrical and mechanical interlocking</li> </ul>

# 5.3 Application and areas of use

The fuseless load feeders can be used in electrical installations wherever combinations of fuses, contactors, and overload relays have been used up to now. The greater functionality of the circuit breaker over fuses, and their suitability as emergency-stop and disconnecting switches, means that many requirements can be met more easily with a fuseless load feeder.

# 5.4 Accessories

#### 5.4.1 Accessories for the individual devices

The accessories for the individual devices can also be used in the load feeder.

You will find information on the accessories of the contactors in Chapter 3, "Contactors" (Section 3.4, "Accessories").

You will find information on the accessories of the circuit breakers in Chapter 2, "Circuit breakers" (Section 2.4, "Accessories").

#### 5.4.2 Accessories specifically for the SIRIUS 3RA fuseless load feeder

The following accessories facilitate the setup and wiring of the fuseless load feeder:

Accessory	Description
Auxiliary switch for the circuit breaker	<ul> <li>Transverse and connectable from above</li> <li>1 changeover contact, 1 normally open contact +         <ol> <li>normally closed contact or 2 nor- mally open contacts</li> </ol> </li> </ul>
Auxiliary switch blocks for the contactor	Snap-on and connectable from below
Link modules	<ul> <li>Provide electrical connections between circuit breakers and link modules</li> <li>Also provide a mechanical connec- tion in frame sizes S00 and S0</li> </ul>
Wiring kits	<ul> <li>Electrical and mechanical connection for reversing combinations</li> <li>The wiring kit can be combined with the link module</li> <li>In the case of frame size S00, the wiring module contains integrated cables for electrical interlocking</li> </ul>

Table 5-1: Fuseless load feeder, accessories

#### 5.4.3 Instructions for self-assembly

#### Fuseless load feeder for rail mounting

Assembly

The following illustration and the table below it show how to assemble the fuseless load feeder:

- Rail mounting
- Frame size S00
- Reversing operation

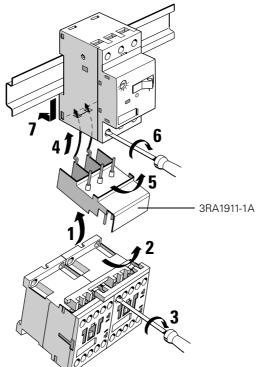

Figure 5-3: Self-assembly, rail, reversing operation (frame size S00)

Step	Procedure
1	Hook the back of the right contactor of the contactor combi- nation onto the link module
2	With a tilting movement, insert the connecting pins of the link module into the upper terminal openings of the contactor
3	Tighten the upper terminal screws of the contactor
4	Hook the link module onto the back of the circuit breaker
5	With a tilting movement, insert the connecting pins of the link module into the lower terminal openings of the circuit breaker
6	Tighten the lower terminal screws of the circuit breaker
7	Snap the circuit breaker and thus the feeder onto the rail

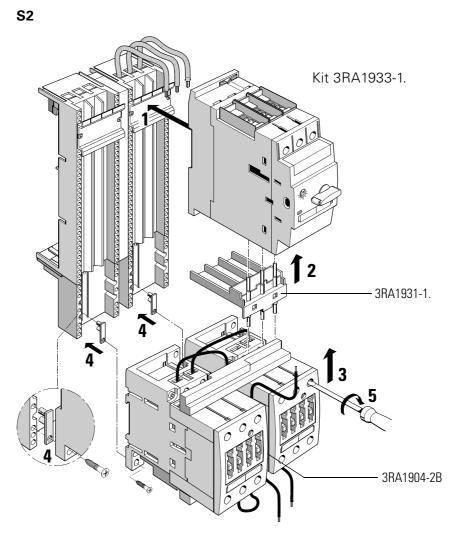

Figure 5-11: Self-assembly, busbars, reversing operation (frame size S2)

# 5.5 Mounting and connection

## 5.5.1 Mounting

#### **Snap-on attachment**

	The fuseless load feeders can be snapped onto a 35 mm rail in acc. with DIN EN 50 022.
Rail mounting without adapter	The fuseless direct feeders of frame sizes S00 and S0 and reversing feeders S00 can be snapped onto the rail without an adapter with the circuit breaker. No tools are required for either mounting or removal. A rail adapter is available as an accessory for frame sizes S00/S0. The reversing feeders of frame sizes S2/S3 are mounted with a rail adapter.
Rail mounting with adapter	To mount frame sizes S2 and S3 and reversing feeders S0 on a rail, adapters must be used for stability reasons. These are available as accessories. To remove them, the rail adapter is unlocked with a screwdriver. You will find information on this in Section 2.5.1 on how to mount circuit breakers. All feeders can be mounted with a rail adapter.

#### Screw-on attachment

Screw-on attachment is implemented in the case of sizes S00 and S0 by means of push-in lugs (see Section 2.4 for information on circuit-breaker accessories).

In the case of sizes S2 and S3, the holes for screw-on attachment are integrated in the mandatory rail adapter.

The following illustration shows screw-on attachment by means of push-in lugs in the case of the fuseless load feeder of frame size S00:.

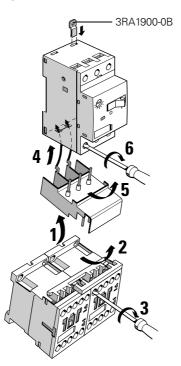

Figure 5-12: Screw-on attachment, fuseless load feeder (frame size S00)

#### Important

In the case of screw-on attachment without a rail adapter, the feeder must not be screwed onto a conductive surface. Insulation is necessary so that, in the event of a short circuit of the circuit breaker, there is no short circuit to the base plate.

#### **Busbar mounting**

The following illustrations show busbar mounting and removal of the fuseless load feeders S00 to S2.

S00 (S0): Mounting S00 (S0): Removal

S2: Mounting

Removal of the extension piece

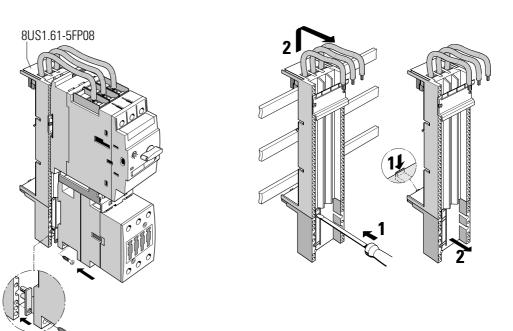

Figure 5-13: Busbar system, mounting/removal (frame sizes S00 to S2)

#### 5.5.2 Connection

The fuseless load feeders are available with the SIGUT<sup>®</sup> terminal system.

#### **Conductor cross-sections**

The following table gives the permissible conductor cross-sections for fuseless load feeders. The specifications apply to main and auxiliary connections.

#### Frame sizes S00 and S0:

	S00	SO	
	A1/A2; NO/NC L1 L2 L3 T1 T2 T3	A1/A2; N0/NC	L1 L2 L3 T1 T2 T3

## 6.2 Device description

Coupling links are interface modules that enable optimal adaptation between electronic controllers and I/O devices, both on the sensor and the actuator side.

They also provide electrical isolation.

#### Overview

The following table offers an overview of the device groups and their distinguishing features:

Device group	Distinguishing features		
Two-tier coupling links 3TX7004/3TX7005	Relay couplers: 6.2 to 22.5 mm width, contact elements: 1 to 3 normally open contacts, 1 to 2 changeover contacts Multi-channel devices Semiconductor couplers: 6.2 to 12.5 mm width Long service life, high switching frequency Screw-type terminal (3TX7004) Cage Clamp terminal (3TX7005)		
Box terminals 3TX7002/3TX7003	Relay couplers: Contact elements: 1 to 2 normally open contacts, 1 to 2 changeover contacts, low device height Semiconductor couplers: Long service life, high switching frequency Screw-type terminal (3TX7002) Cage Clamp terminal (3TX7003)		
Plug-in relay coupling links LZX: RT/PT/MT	Plug-in relays (1 to 4 changeover contacts) High switching currents, prewiring possible		
Coupling links for direct attachment to contactor coils 3RH1924/3TX4090/3TX7090	Space-saving, adapted to contactor type, reduced wiring 3RH1924 for frame sizes S0 to S3 3TX4090 for 3TH42/43 auxiliary contactors 3TX7090 for frame sizes 3 to 14		
SIRIUS contactor relays3RT10 3RH11	For main circuits: switching from motors to 11 kW directly For main circuits: up to 4 auxiliary switches		

Table 6-2: 3RH, 3TX, LZX coupling links - overview of the device groups with their distinguishing features

Contact materialRelay coupling links are offered with AgNi and hard gold-plated contacts.<br/>Hard gold-plated contacts have greater contact reliability at low voltages and<br/>currents. They can be used as of mV or μA. They can be used to switch low<br/>levels of power, such as those involved in measurement and control signals.<br/>In the case of input coupling links, they are to be recommended on account<br/>of the low currents of the input modules of controllers.

Models	Advantages	Disadvantages		
Relay coupling modules         6.2 mm       12.5       17.5       22.5         • Single- channel       • Multi- channel       • Multi- channel       • Without switch       • Without switch       • Without switch       • 2W         • 1W/1NO/ 2NO       • NO       • 2W       • 2W       • 2W	<ul> <li>Suitable for direct and alternating voltage</li> <li>High switching capacity without heat generation</li> <li>Virtually no transfer resistance (suitable as measured value transfer switch)</li> <li>Electrical isolation</li> <li>Safe isolation between contact and coil sides</li> <li>No leakage current</li> <li>High noise immunity</li> <li>Insensitive to overloads and voltage peaks</li> <li>Several switching levels</li> </ul>	<ul> <li>Lower switching frequency</li> <li>Contact erosion, particularly</li> </ul>		
Semiconductor coupling modules 6.2 mm 12.5  • Single- channel • Single-channel • With M-O-A switch • Without switch • Table 6-3: Comparison: Belay coupling modules a	<ul> <li>No contact welding in the case of capacitive loads</li> <li>High switching frequencies</li> <li>High direct-current switching capacity</li> <li>Long service life</li> <li>Bounce-free switching</li> <li>Insensitive to vibrations and impact</li> <li>Defined transfer resistance and volume resistance</li> <li>Safe isolation between drive circuit and load in acc. with DIN VDE 0884</li> <li>Silent switching operation</li> </ul>	<ul> <li>High temperature rise in the case of high loads</li> <li>Leakage current at output</li> <li>Sensitive to peaks in the power system</li> <li>Not suitable as measured value transfer switch because of a voltage drop at the switching transistor</li> </ul>		

#### 6.2.1 Relay coupling modules versus semiconductor coupling modules

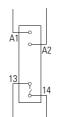

Table 6-3: Comparison: Relay coupling modules and semiconductor coupling modules

## 6.2.2 Coupling links in two-tier and box terminal format

#### Features

- Connections at two levels
- Very narrow design, as of 6.2 mm
- Terminal system: screw-type and Cage Clamp
- Labeling strip to identify equipment

**Models** The 3TX70 coupling links for SIRIUS are available as both input couplers and output couplers, which have their terminals in different positions:

Figure 6-1: Output couplerInput coupler

Input coupling links have hard gold-plated contacts for greater contact reliability at low voltages and currents.

Status indicationA yellow status LED on the drive circuit side indicates whether there is any<br/>control supply voltage applied to the coupler.

**Protective circuit** There is an integrated rectifier at the input of each coupler. As a result, they are protected against polarity reversal. The rectifiers function as flywheeling diodes at disconnection. Semiconductor outputs are protected by suppressor or Zener diodes.

**Manual-0-automatic** Some coupling links are equipped with a manual-0-automatic switch that makes it easier to switch the system on and is used for test purposes.

- Manual: Relay is always on
- O (zero): Relay is always off
- Automatic: Relay follows the control supply voltage

**Power consumption** Following on from the technical specifications of the electronic systems, the coupling links have low power consumption. They can be controlled from a programmable controller and are suitable for continuous duty.

Accessories

The following accessories are available for two-tier coupling links:

- 24-pole connecting lead or connection comb
- Screwdriver for Cage Clamp terminal system
- End holder and end plate

## 6.2.3 Plug-in relay coupling links

	The Plug-in relay coupling links are modular coupling links. The plug-in for- mat means the relays can be easily replaced.
Models	There are complete modules for 1 and 2 changeover contacts and individual modules for 1, 2, 3 or 4 changeover contacts for a rated control supply voltage of either 24 VDC or 230 VAC.
Widths	<ul> <li>Plug-in relay coupling links are available in 3 widths:</li> <li>15.5 mm print relays, LZX: RT variants</li> <li>27 mm mini-industrial relays, LZX: PT variants</li> <li>38 mm industrial relays, LZX: MT variants</li> </ul>
Installation	The plug-in relay coupling links are plugged into the associated bases, and these are snapped onto a 35 mm rail in acc. with EN 50 022.
Surge suppression	To avoid high breaking voltage peaks, LZX: RT and PT plug-in relay coupling links are available for a rated control supply voltage of 24 VDC, with 1, 2, or 4 changeover contacts (Ws) and integrated surge suppression (flywheeling diode). RC elements are available for AC voltages.
Connection	<ul> <li>The standard polarity must be taken into consideration when connecting up:</li> <li>At A1: positive voltage supply (+)</li> <li>At A2: negative voltage supply (-)</li> </ul>
Test button	The LZX: PT and MT variants are equipped with a test button. The plug-in relay coupling link can thus be brought into the switching state and locked without the need for electrical triggering. When the test button is protrud-ing, this indicates the locked switching position.
LED	An LED is available either as an individual plug-in module or is integrated in the relay, depending on the variant involved.
Power consumption	Following on from the technical specifications of the electronic systems, the coupling links have low power consumption.
Safe isolation	The drive circuit and contacts are electrically isolated. Safe isolation can also be achieved for the print relays (LZX:RT series) by means of a special base.

## 6.2.4 Coupling links for direct attachment

Contactors S0 to S3	The 3RH1924-1GP11 coupling relay, which is screwed directly onto the coil terminals, is available for direct attachment to the contactors of frame sizes S0 to S3. The 3TX4090-0C/-0D coupling links are suitable for attachment to 3TH42/43 auxiliary contactors.
Contactors of up to 450 kW	In the case of the large contactors of up to 450 kW (size 14), the 3TX7090 coupling link can be snapped on at the side like an auxiliary switch block, and the wires are connected to the contactor coil terminals.
Variants	There are variants with one normally open contact, 24 VDC, with and with- out surge suppression. The operating range is 17 to 30 VDC.
Installation	The 3TX 4090 and 3RH1924-1GP11 coupling links are screwed directly onto the contactor coil terminals, and the 3TX7090 coupling links are snapped on at the side like the auxiliary switches.
Surge suppression	<ul> <li>The following coupling links have an integrated surge suppressor (varistor) for the contactor coil to be switched:</li> <li>3RH1924-1GP11</li> <li>3TX4090-0D</li> <li>3TX7090-0D</li> </ul>
Power consumption	Following on from the technical specifications of the electronic systems, the coupling links have low power consumption.
LED	An LED is integrated in the coupler.

## 6.2.5 SIRIUS contactor relays

The SIRIUS 3RT10/3RH11 contactor relays are described in Chapter 3, "Contactors".

## 6.2.6 Installation

Attachment	Snap-on attachment
	The coupling links can be snapped onto a 35 mm rail in acc. with
	DIN EN 50 022.
	Screw-on attachment is not possible.

## Connection

## Screw-type terminals

The two-tier coupling links are fitted with slotted screws for a maximum screwdriver blade width of 4 mm. Plug-in relay couplers have plus-minus POZIDRIV 2 screw-type terminals.

## **Cage Clamp terminals**

The two-tier coupling links described in Section 6.2.1 are available with Cage Clamp terminals as well as screw-type terminals.

## 6.2.7 Notes on configuration

# **Contact microwelding** When capacitive loads are switched, a short-circuit current briefly occurs (for a period lasting only microseconds) if the capacitor is not connected in series with a resistor. This can result in contact microwelding and the contact being unable to open after the control supply voltage is removed. To prevent this from happening, a resistor can be connected in series, or a coupling link with a semiconductor output and short-circuit protection can be used.

Switching inductive loads The contacts are tested in acc. with EN 60947-5-1, utilization category AC-15 and DC-13. Going beyond the requirements of the standard, a continuous test was carried out on the contacts with an AC-15 load for 100,000 operating cycles. The electrical service life of the contacts was thus tested over 100,000 operating cycles at the specified current under normal conditions. A lower load on the contacts or a protective circuit for the inductive load increases the service life of the contacts. If this service life is insufficient, a semiconductor coupler with an unlimited service life must be used.

# Max. line length in AC operation Each wire has a line capacitance that works like a capacitor connected in series to the coupling link. The effect of this in operation with alternating current is that so much current may flow due to the line capacitance that the coupling link does not fall in spite of a switch being open. To remedy this, a parallel resistor can be fitted to A1/A2 of the coupling link, or an RC combination can be used. Both of these measures change the performance and switching times of the coupling link.

The following basic circuit diagram shows the line capacitance:

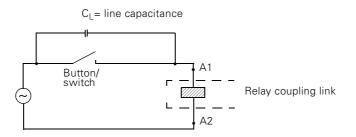

Figure 6-2: Basic circuit diagram, line capacitance

The line lengths specified in the NSK catalog were calculated for a line capacitance of 0.3 nF/m. This depends on the wire used.

## 6.2.8 Explanation of terms

Electrical isolation	There is no conductive connection between the input circuit and the output circuit. Electrical isolation is ensured by the in-built relay and, in the case of semiconductor outputs, by means of optocouplers.
Safe isolation	Safe isolation provides protection against shock currents in different circuits. It is implemented by means of increased creepages and clearances.
Distinction between terms	Electrical isolation is not necessarily safe isolation. Safe isolation is a protective measure against shock current, the primary purpose of which is to prevent injury. It prevents the voltage of one circuit crossing over into another.
	For the insulation coordination of equipment, the standard specifies values for the rating of the creepages and clearances.
	In the case of safe isolation, these values must be selected by means of double or reinforced insulation.

## 6.3 Application and areas of use

## 6.3.1 General information

Advantages	<ul> <li>The use of coupling links offers the following advantages:</li> <li>Galvanic isolation between two circuits</li> <li>Current gain</li> <li>Protects the controller from interference and overvoltage</li> <li>Substantially reduces the power input of switchgear</li> <li>Permits power gain or level adaptation</li> </ul>
Applications	<ul> <li>Coupling links are used in:</li> <li>Production engineering</li> <li>Machine setup</li> <li>Process control in power distribution</li> <li>Building services automation</li> <li>Process engineering</li> </ul>
Usage	<ul> <li>Coupling links are used for:</li> <li>Floating signal transmission</li> <li>Linking of different voltages (AC/DC) and currents</li> <li>Power gain</li> <li>Level adaptation</li> <li>Protection of the controller against EMC noise from the I/O</li> <li>Contact multiplication</li> </ul>
Application example	I/O Electronic controller In- Out- 24 VDC In- Out- 24 VDC 230 VAC

Figure 6-3: Application example, coupling links in box terminal format

## 6.3.2 Criteria for selection

Coupling links are selected on the basis of a number of criteria:

### **Technical specifications** See Section 6.7:

- Rated control supply voltage Us
- Typical power input
- Output elements
- Rated operational currents I<sub>e</sub>
- Permissible line length

## Mechanical requirements

- Construction type, width
- Mounting type
- Indicators
- Connection type
- Replaceability

## Selection table

The following table provides an overview of the main criteria for selection from different device groups:

Device group	Criteria for selection
Two-tier coupling links	<ul><li>Space-saving due to narrow housing width</li><li>Test switches</li></ul>
Coupling links in box terminal format	<ul><li>Low device height</li><li>For installation given narrow tier spacing</li></ul>
Contactor relays for switching main and auxiliary circuits	<ul> <li>High switching currents</li> <li>Direct switching of motors up to 11 kW</li> <li>Up to 4 auxiliary contacts</li> </ul>
Plug-in relay coupling links	<ul><li>High switching currents</li><li>Quickly interchangeable</li><li>Up to 4 changeover contacts</li></ul>
Coupling links for attachment to contactors	<ul> <li>Attachable directly onto the contactor</li> <li>Technical specifications of the contactor to be controlled</li> </ul>

Table 6-4: Selection criteria for the 3RH, 3TX, and LZX coupling links

## 6.4 Accessories

## 6.4.1 Accessories for two-tier coupling links

**Connecting lead** 

The 24-pole connecting lead 3TX7004-8BA00 can be used for all two-tier coupling links both with screw-type and Cage Clamp terminals:

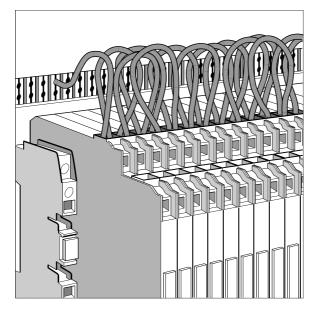

Figure 6-4: 24-pole connection lead for two-tier coupling links

# **Connection comb** The 24-pole connection comb 3TX7004-8AA00 can be used for the 6.2 mm wide two-tier coupling links with screw-type terminals:

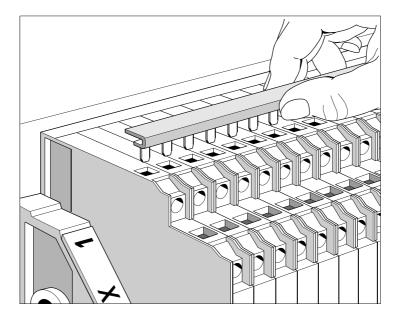

Figure 6-5: 24-pole connection comb for two-tier coupling links

End holder	The end holder 8WA2808 is snapped onto the rail (EN 50 022) without screws.
Screwdriver for Cage Clamp terminal system	The screwdriver 8WA2804 is suitable when wiring coupling links with Cage Clamp terminals.
End plate	In order to ensure shock protection in the case of the two-tier optocouplers having a width of 6.2 mm and with a housing opening (e.g. 3TX7 004- 3AB04), the individual module or last module in a series must be fitted with an end plate 3TX7004-8CE00.
Labeling strip	Each coupling link has a labeling strip for the purpose of identification.
6.4.2 Accessories for LZ	X plug-in relay coupling links
Retainer	In situations where there is increased mechanical stress, a retainer can be fitted to plug-in relay coupling links to provide stability.
LED module	An LED can be fitted as an individual plug-in module with the variants LZX: RT and LZX:PT.
Module with flywheel- ing diode	A flywheeling diode for surge suppression can be fitted as a module (for DC voltages) with the variants LZX:RT and LZX:PT.
RC module	For AC voltages, there is a plug-in RC module available with the series LZX:RT and LZX:PT for surge suppression.

## 6.5 Mounting and connection

## 6.5.1 Mounting

Snap-on attachmentThe coupling links are snapped onto 35 mm rails in acc. with EN 50 022.With a vertical rail and tightly packed devices, the permissible ambient temperature  $T_U$  is 60° C.<br/>Any installation position is possible.

## 6.5.2 Connection

The coupling links are available with the SIGUT<sup>®</sup> terminal system, with screw-type terminals, or with Cage Clamp terminals.

## Cage Clamp terminals

## Important Risk of injury

When making connections using the Cage Clamp terminal system, you should support your screwdriver with your finger to prevent the screwdriver slipping.

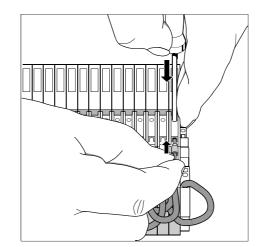

Figure 6-6: Cage Clamp terminals, coupling links

# Conductor cross-sections

The following table shows the permissible conductor cross-sections for the coupling links. The specifications apply to main and auxiliary connections.

	3TX7004 3TX7002 screw-type termi- nals	3TX7005 3TX7003 Cage Clamp terminals	LZX: RT/ZT/MT	3RH1924 3TX7090 Screw-type termi- nals

## 7.1 Specifications/regulations/approvals

Standards	<ul> <li>The time relays comply with the following standards:</li> <li>IEC 61812-1/DIN VDE 0435 Part 2021 on electrical relays and time relays</li> <li>IEC 61000 on electromagnetic compatibility</li> <li>IEC 60947-5-1; DIN VDE 0660 Part 200 on low-voltage switchgear</li> <li>IEC 60721-3-1/-3 on environmental conditions</li> <li>IEC 60529 on degree of protection</li> </ul>
Electromagnetic com- patibility	The time relays are tested in acc. with EN 50 081-1 (emission) and EN 50 082-2 (immunity) and are thus noise-free and surge-proof.
Switching capacity	The switching capacity complies with IEC 60947-5-1 In the case of utilization category AC-15 and 230 VAC: 3 A In the case of utilization category DC-13 and 24 VDC: 1 A In the case of utilization category DC-13 and 48 VDC: 0.45 A In the case of utilization category DC-13 and 60 VDC: 0.35 A In the case of utilization category DC-13 and 110 VDC: 0.2 A In the case of utilization category DC-13 and 230 VDC: 0.1 A
UL/CSA/marine approval	The SIMIREL time relays are approved by UL and CSA for use worldwide and tested by the GL, LRS, DM marine authorities.
Approvals/ test reports	Confirmation of approvals, test certificates, and the declaration of confor- mity can be obtained on the Internet/intranet.

## 7.2 Device description

Time relays are used for different control tasks in automatic production lines and for processing machines.

They are suitable for all time-delayed switching operations in control, starting, protective, and regulating circuits and ensure high repeatability of the set run times.

7.2.1 Device types
The SIMIREL 3RP1 time relays are available in the following forms:

Single-function devices, such as the on-delay function
Multifunctional devices

Frame sizes

The SIMIREL 3RP1 time relays are available in two widths:
3RP10: 45 mm
The width, height, and depth of time relays and contactors of frame size S00 (3RT/3RH10) are identical. The terminals are therefore on the same level, and the tier spacing in the cubicle can be kept correspondingly low.
3RP15: 22.5 mm
Time relays with 1 changeover contact are 82 mm in height and have six possible terminals
Time relays with 2 changeover contacts are 102 mm in height and have a

## View of the 3RP10

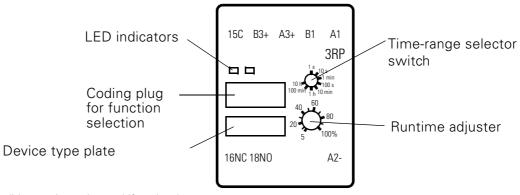

Figure 7-1: 3RP1000 solid-state time relay, multifunctional

### **3RP10** features

The features of the 3RP10 solid-state time relay:

• 1 changeover contact

possible twelve terminals

- Eight selectable time ranges
- Adjustable runtime from 0.05 s to 10 hr
- Contact position and voltage indication by means of LED
- Safe isolation between the control and load sides in acc. with DIN VDE 0106 Part 101
- Combination voltage 24 VAC/VDC / 200-240 VAC and 24 VAC/VDC / 100-127 VAC
- Single-function device for the on-delay function
- Multifunctional device with 7 functions

## View of the 3RP15

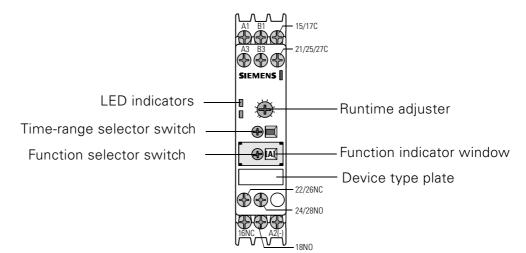

Figure 7-2: 3RP15 solid-state time relay, multifunctional with 2 changeover contacts

3RP15 features	<ul> <li>The features of the 3RP15 solid-state time relays are:</li> <li>1 changeover contact (8 functions)</li> <li>2 changeover contacts (16 functions)</li> <li>Single or up to 15 selectable time ranges</li> <li>Contact position and voltage indication by means of LEDs</li> <li>Combination voltage 24 VAC/VDC / 200-240 VAC, and 24 VAC/VDC / 100-127 VAC</li> <li>Wide-range voltage variant for 24-240 VAC/VDC</li> <li>Single-function devices for the following functions:</li> <li>On-delay with 1 or 2 changeover contacts</li> <li>Off-delay with auxiliary supply and 1 changeover contact</li> <li>Off-delay without auxiliary supply and 1 or 2 changeover contacts</li> <li>Clock pulse generator with 1 changeover contact</li> <li>Star-delta with 2 NO contacts</li> <li>2-wire, on-delay with semiconductor output</li> <li>Multifunctional time relay with 8 (1 changeover contact) or 16 functions (2 changeover contacts)</li> </ul>

	<ul> <li>Push-in lugs for screw-type terminal</li> </ul>
7.2.2 Installation	
Attachment	<ul> <li>Snap-on attachment</li> <li>All the time relays can be snapped onto 35 mm rails and removed without tools in acc. with EN 50 022.</li> <li>Screw-on attachment</li> <li>3RP10: attachment openings are integrated in the device</li> </ul>

Connection	The terminals of the 3RP1 time relays are designed for connections of the control cables with a maximum stripped length of 10 mm. Cross-sections of 2 x 0.5 to 2.5 mm <sup>2</sup> (single-coil) and 2 x 0.5 to 1.5 mm <sup>2</sup> (single-coil) can be clamped with a wire end ferrule. <b>Screw-type terminal (SIGUT<sup>®</sup> terminal)</b> The 3RP10 and 3RP15 time relays are available with plus-minus Pozidriv 2 screw-type connections. <b>Cage Clamp terminal</b> The 3RP10 and 3RP15 time relays are available with Cage Clamp terminals
	The 3RP10 and 3RP15 time relays are available with Cage Clamp terminals.

## 7.2.3 Special features

Operating temperature	There are no restrictions on the control supply voltage, switching current, or duty cycle for operation between -25 °C to +60 °C.
Time ranges	There are up to 15 time settings, ranging from 0.05 s to 100 hr. The 3RP15 has additional time settings between the decade scales (1/10/100 s/min/h) that make high setting accuracy possible.
Wide-range voltage	There are multifunctional relays with a wide voltage range of 24 VAC/VDC to 240 VAC/VDC.
Electrical service life	The electrical service life with contactor load (e.g. 3RT1016 contactor) is 10 million operating cycles. The electrical service life at AC voltage of 230 V, utilization category AC-15/ 3 A, and at DC voltage, utilization category DC-13/1 A, is 100,000 operating cycles.
Start contact	In the case of functions that require a continuous auxiliary supply to termi- nals A1/A2 and A3/A2, the time function can be started by a control supply voltage to terminal B1 or B3.

## 7.2.4 Notes on configuration

	The following specifications must be complied with to ensure error-free operation of the solid-state time relays:		
Start input	Only apply the control supply voltage from start input B1 or B3 once the supply voltage has already been applied to A1/A2 or A3/A2.		
Identical potential	Identical potential must be applied to terminals A1 and B1 or A3 and B3.		

Combination voltage	In the case of combination voltage types, only one voltage range can be connected. Never apply the two control supply voltages simultaneously.
Parallel load at the start contact	The start contact is under voltage and rectified. There is a connection in the time relay to the A1 and A2 terminals. The control of loads parallel to the start input is therefore not permissible at AC 50/60 Hz control supply voltage.
	The following information facilitates configuration of SIMIREL 3RP time relays:
Combination/wide- range voltages	<ul> <li>80% of the time relay types are combination and wide-range voltage types because they are flexible in their uses:</li> <li>Combination voltage: two operating voltage ranges (e.g. 24 VAC/VDC and 200 to 240 VAC) at different terminals</li> <li>Wide-range voltage: one operating voltage range from 24 VAC/VDC to 240 VAC/VDC at the same terminals</li> </ul>
Two-wire time relay	<ul> <li>Two-wire time relays have the following advantages over conventional time relays in connection with contactors:</li> <li>Reduced wiring</li> <li>Bounce-free control</li> <li>The electronic output increases service life because no mechanical wear occurs.</li> <li>Greater switching frequency</li> </ul>
Special functions	<ul> <li>Pulsing function: pulse and idle time can be set separately.</li> <li>Flashing: the pulse/break ratio is 1:1.</li> <li>The timing period starts with the "off-delay without auxiliary supply" function if the time relay is separated from the supply voltage.</li> <li>In the case of the 3RP15 time relay with 15 selectable time settings, there is a ∞ switch position. This means an endless timing period. If this setting is chosen for the on-delay function, the output relay never switches through after the supply voltage has been applied (off function). In the case of the "making pulse contact" function, the output relay always remains on (on function). This can be used for test purposes.</li> <li>In the case of the "additive on-delay with auxiliary supply" function, the time is added for as long as the start contact is activated. If the start contact is interrupted, the timing period stops and is then continued once the start contact is closed again. This function is not non-volatile and requires a continuous auxiliary power supply.</li> <li>In the case of the "shaping pulse contact with auxiliary supply" function, an activated start contact triggers a timing period that can be set. The control signal for this can be shorter or longer than the desired runtime.</li> </ul>
Cable ducts	If you use cable ducts for wiring, the position and dimensions of the termi- nal blocks must be taken into consideration (see pages 7-27).

## 7.2.5 Explanation of terms

Setting accuracy	Setting accuracy is the accuracy in relation to the end value of the scale in line with the specified tolerance.
Repeatability	Repeatability describes the accuracy with which the set value can be repro- duced with the specified tolerance.

## 7.3 Applications and uses (types of function)

## 7.3.1 Multifunction (3RP10 00 solid-state time relay)

The time relay contains a changeover contact.

Operating time adjust-<br/>mentEight time ranges can be set by means of a rotary switch.<br/>The desired runtime can be set accurately by means of a potentiometer (ro-<br/>tary switch for fine adjustment).

#### Important

Changes to the time range are only effective if they are made in a deenergized state.

#### Example

You want to set a duration of 5 seconds:

Step	Procedure	
1	10 h 100 min 1 h 10 min 100 s	Rotate the time range selector switch to 10 s. This means runtimes of up to 10 seconds can be set.
2	40,60 20,5,00%	Rotate the potentiometer to 50% for fine adjustment. In other words, 50% (= 5 seconds) of the maximum value (10 seconds) is set.

Table 7-1: 3RP10 00 (multifunctional) operating time adjustment

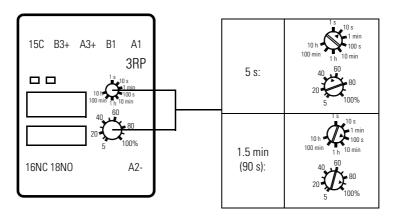

Figure 7-3: 3RP10 00 (multifunctional) operating time adjustment

## Functions

You can select 7 different functions with the coding plug set (7PX9904) provided.

### Important

Changes to the function are only effective if they are made in a deenergized state.

Without the coding plug the multifunctional time relay (3RP10 00) is programmed for the on-delay.

# **Function setting** The connector with the function you want is removed from the coding plug set and put on the time relay as shown in the following diagram:

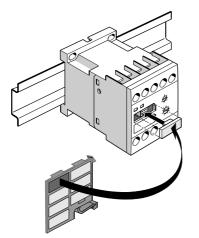

Figure 7-4: 3RP10 00 (multifunctional) function setting

The name of the function and the corresponding circuit diagram are printed on the coding plugs in German and English.

## Function diagrams

The coding plug set contains the functions for the 3RP1000 solid-state time relay listed in the following table:

Function	Circuit diagram	Function diagram
On-delay	IA. IA2 16 NC  18 NO ansprechverzögert ON DELAY	A./A2
Off-delay with aux- iliary supply	IA2 IB 15 C IA2 II6 NC  18 NO rückfallverzögert OFF DELAY	A./A2 B./A2 15/18 15/16
On-delay and off- delay with auxil- iary supply	IA. IB. IA2 II6 NC  18 NO ansprech-/rückfallverzögert ON/ OFF DELAY	A./A2 B./A2 15/18 15/16 $t_{an}$ $t_{an}=t_{ab}$
Flashing, start with break	IA. IA2 IA2 IA2 IA2 IA2 IA IA2 IA IA IA IA IA IA IA IA IA IA	A/A2 15/18 15/16 t t t t
Making pulse con- tact	IA. IA2 IIA2 IIG NC II8 NO Wischer Ein IMPULSE ON	A./A2
Breaking pulse con- tact with auxiliary supply	IA2 II6 NC II8 NO Wischer Aus IMPULSE OFF	A./A2 B./A2 15/18 15/16 → t
Shaping pulse con- tact with auxiliary supply	IA: IB: 15 C IA2 IIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIIII	A./A2 B./A2 15/18 15/16

Table 7-2: 3RP10 00 (multifunctional) circuit diagrams and function diagrams

### Important

The same potential must be applied to terminals A and B.

A./A2  $\triangleq$  A1/A2 or A3/A2, depending on the voltage level connected B./A2  $\triangleq$  B1/A2 or B3/A2, depending on the voltage level connected

## 7.3.2 Multifunctional (3RP15 05 solid-state time relay)

Operating time adjustment Fifteen time ranges can be set using a rotary switch, ensuring very precise adjustment. The set time range is displayed in a window next to the rotary switch.

The desired runtime can be set accurately by means of a potentiometer (rotary switch for fine adjustment).

In the time range position  $\infty$  the function is executed with an endless time period. This means, for example, that the output relay never switches through when "on-delay" is set and the supply voltage is applied or that the output relay remains continuously on when "making pulse contact" is set.

## Important

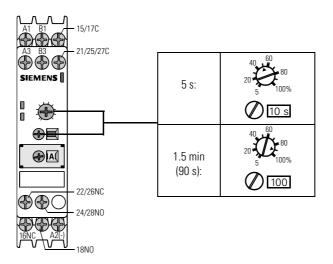

Changes to the time range are only effective if they are made in a deenergized state.

## Example

You want to set a 90 second period:

Step	Procedure	
1	1005	Rotate the time range selector switch until 100 s appears in the adjacent window. This means runt- imes of up to 100 seconds can be set.
2	40 60 20 5 80 100%	Rotate the potentiometer to 90%. In other words 90% (= 90 seconds) of the maximum value (= 100 seconds) is set.

Table 7-3: 3RP15 05 (multifunctional) operating time adjustment

### **Functions**

The following can be set by means of a rotary switch.

- Time relay with 1 changeover contact: 8 functions
- Time relay with 2 changeover contacts: 16 functions

## Important

Changes to the function are only effective if they are made in a deenergized state.

## **Function setting** The function is set using a rotary switch and is indicated by an identifying letter in the adjacent window.

The set function can be labeled distinctly with an identification plate with the corresponding function diagram. At the same time, a mechanical code ensures that the correct function is set by ensuring that a label can only be clipped on if the corresponding function is set using the rotary switch. A label set with function diagrams of all the functions that can be set for the time relay is available as an accessory.

Break the label of the set function out of the label set, and snap it firmly onto the time relay as shown in the following diagram:

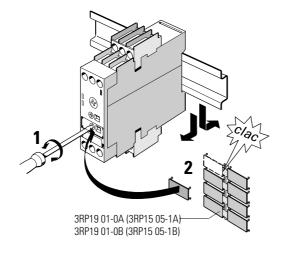

Figure 7-6: 3RP15 05 (multifunctional) function identification

# **Identifying letters** The following table lists the identifying letters for the 8 or 16 functions of the solid-state multifunctional 3RP15 05 time relay:

Function	Identifying letter with time relay with 1 changeover contact	Identifying letter with time relay with 2 changeover contacts
On-delay	А	А
Off-delay with auxiliary supply	В	В
On-delay and off-delay with auxiliary supply	С	С
Flashing, start with break	D	D
Making pulse contact	E	E
Breaking pulse contact with auxiliary supply	F	F
Shaping pulse contact with auxiliary supply	G	G
Additive on-delay with auxiliary supply (and immediate switching only $H{\scriptstyle \bullet})$	Н	H•
On-delay and immediate switching		A•
Off-delay with auxiliary supply		B∙
On-delay and off-delay with auxiliary supply and immediate switching		C•
Flashing, start with break, and immediate switching		D•
Making pulse contact and immediate switching		E∙
Breaking pulse contact with auxiliary supply and immediate switching		F∙
Shaping pulse contact with auxiliary supply and immediate switching		G•
Star-delta function		ΥΔ

Table 7-4: 3RP15 05 (multifunctional) assignment of the identifying letters

The • after the identifying letter indicates that the second changeover contact present reacts as an immediate switching contact (controlled by the supply voltage or the start contact depending on the function). If this • is not present, the second changeover contact reacts with a time delay like the first changeover contact.

## Function diagrams Circuit diagrams

The following table explains the 8 or 16 functions of the solid-state multifunctional 3RP15 05 time relay using circuit diagrams and function diagrams:

Identifying letter	Device circuit diagrams	Function diagram
A On-delay		A./A2
B Off-delay with auxiliary sup- ply		A./A2
C On-delay and off-delay with auxiliary supply (t=t <sub>on</sub> =t <sub>off</sub> )		A /A2

## 7.3.3 On-delay

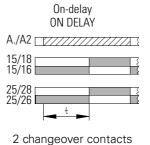

The function diagram for the time relay with 1 changeover contact and with 2 changeover contacts:

#### **Function diagrams**

On-delay

ON DELAY

1 changeover contact Figure 7-9: 3RP15 25 function diagram

#### The 3RP15 27 solid-state time relay (two-wire time relay)

The two-wire time relay is connected in series with the load. The timing period begins after the control supply voltage has been applied. The semiconductor output then becomes live, and voltage is applied to the load. Four time ranges can be set by means of a rotary switch.

**Time ranges** 

#### Important

Attention must be paid to the rated operational current, residual current with unswitched output, and voltage drop in the case of a switched output.

**Function diagram** 

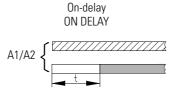

Figure 7-10: 3RP15 27 function diagram

7.3.4 Off-delay

#### The 3RP15 31/32/33 solid-state time relay with auxiliary supply

The time relay contains 1 changeover contact.

Fixed time ranges are offered: 10 s, 30 s, 100 s

Time ranges

Function diagram

Off-delay OFF DELAY

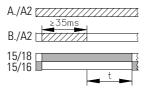

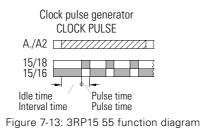

Figure 7-11: 3RP15 3. function diagram

There is continuous auxiliary voltage (A./A2) at the time relay. If a control supply voltage is applied to the start contact, the output relay switches over. After the start contact is disconnected, the set runtime starts. The minimum on-time of  $\geq$  35 ms must be adhered to.

	The 3RP15 40 solid-state time relay without auxiliary supply
	The time relay is available with either 1 or 2 changeover contacts.
Time ranges	Seven time ranges can be set by means of a rotary switch. Times ranging from 0.05 to 100 s are possible.
	<b>Important</b> Changes to the time range are only effective if they are made in a deenergi- zed state.
	The function diagram for the time relay with 1 changeover contact and with 2 changeover contacts:
Function diagrams	Off-delay Off-delay OFF DELAY OFF DELAY
	≥ 200ms
	≥ 200ms 15/18
	A1/A2
	1 changeover contact 2 changeover contacts
Mode of operation	Figure 7-12: 3RP15 40 function diagram When the rated control supply voltage is applied, the time relay switches over. After the rated control supply voltage has been disconnected, the runt- ime t starts. After t has finished, the relay switches back to the quiet state. If the minimum on-time is not adhered to, it is ensured that either the timing period will not start or that a started timing period will always be properly completed. Intermediate states in the function process, such as the relay getting stuck, are successfully prevented.
7.3.5 Clock pulse gene	rator (3RP15 55 solid-state time relay)
Description	The idle time and the pulse time of the clock pulse generator and the time ranges must be set separately. The pulsing function begins with the break.
	The time relay contains a changeover contact.
Time ranges	Fifteen time ranges can be set by means of a rotary switch.
	Important Changes to the time range are only effective if they are made in a deepergi

Changes to the time range are only effective if they are made in a deenergized state. A pulse, for example, can be output cyclically for 1 second after a break of 1 hour.

#### **Function diagram**

#### 7.3.6 Star-delta function (3RP15 74/76 solid-state time relay)

Description The instantaneous star contact and the time-delayed delta contact have a shared contact root. To avoid phase short circuits, the switchover break from star to delta is 50 ms.

**Time ranges** The time relay offers a fixed time range: 20 s, 60 s

#### **Function diagram**

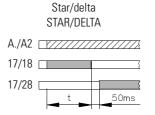

Figure 7-14: 3RP15 7. function diagram

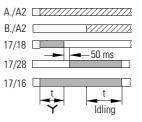

#### 7.3.7 Star-delta function with overtravel (3RP15 60 solid-state time relay)

**Description** Supply voltage is applied to A./A2 and there is no control signal at B./A2. This starts the  $\Upsilon \Delta$  timing period. By applying the control signal to B./A2, the idling time (overtravel time) is started. When the set time  $t_{\text{Idling}}$  (30 s to 600 s) is completed, the output relays (17/16 and 17/28) are reset. If the control signal is switched off at B./A2 (minimum off-time 270 ms), a new timing period is started.

Time rangesStar-delta time 1 s to 20 sOvertravel time: 30 s to 600 s

#### **Function diagram**

Star-delta with overtravel STAR/DELTA with idling

### 7.4 Accessories

#### 7.4.1 Accessories for 3RP10

Coding plug set

Included with the 3RP10 00 solid-state time relay is a coding plug set for 7 functions. The function is set by clipping on a label with that function on it. The following diagrams show you how to affix the coding labels:

Figure 7-15: Coding plug set (3RP10 00)

This coding plug set is also available separately as 7PX9904.

#### 7.4.2 Accessories for 3RP15 05

Label set

Two label sets are available to the 3RP15 05 solid-state time relay, multifunction device for labeling, depending on the version (8 functions with 1 changeover contact, 16 functions with 2 changeover contacts):

• 3RP19 01-0A for the 3RP15 05-1A electronic relay, 1 changeover contact

• 3RP19 01-0B for the 3RP15 05-1B electronic relay, 2 changeover contacts The following table shows you how to set the function on the time relay and put on the label:

Illustration	Procedure
3RP19 01-0A (3RP15 05-A) 3RP19 01-0B (3RP15 05-B)	<ul> <li>1 The desired function is set on the potentiometer of the time relay using a screwdriver.</li> <li>2 The corresponding label iden- tifying the set function is clipped on.</li> </ul>

Figure 7-16: Label set (3RP15)

**Sealable cover** All 3RP15 solid-state time relays can be secured against unauthorized adjustment by means of a sealable cover (3RP19 02). The following table and illustration explain how to do this:

Illustration	Procedure
2 3RP19 02	<ul> <li>1Break off the key for interlocking from the upper edge of the cover.</li> <li>2Use the hook to put the cover in the openings to the side of the device identification label.</li> <li>3Move the cover toward the time relay.</li> </ul>
	<ul> <li>4Hook the key onto the time relay through the slit in the cover to attach the cover to the time relay.</li> <li>5/6 Pull the seal through the opening of the key.</li> </ul>

Table 7-6: Sealable cover

#### Push-in lugs for screwtype attachment

Push-in lugs (3RP19 03) are available for the screw-type attachment:

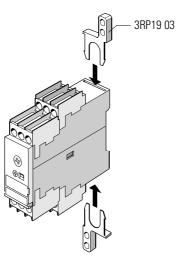

Figure 7-17: Screw-on attachment

## 7.5 Mounting and connection

#### 7.5.1 Mounting

#### 3RP10

**Snap-on attachment** The 3RP10 time relays can be snapped onto the 35 mm rails and removed without tools in acc. with EN 50 022.

Place the time relay on the upper edge of the rail, and press it downward until it snaps onto the lower edge of the rail. To remove the time relay, press it downward to release the tension of the spring, and the time relay can be removed.

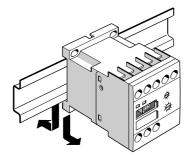

Figure 7-18: 3RP10: mounting on and removal from a 35 mm rail

**Screw-on attachment** 

t The following is required for screw-type attachment of the 3RP10 time relay:

- 2 M4 screws, diagonal
- Maximum tightening torque of 10.5 Nm
- Washers and spring lock washers must always be used
- The distance to grounded parts at the side must be more than 6 mm

#### 3RP15

**Snap-on attachment** The 3RP15 time relays can be snapped onto the 35 mm rails and removed without tools in acc. with EN 50 022.

Place the time relay on the upper edge of the rail, and press it downward until it snaps onto the lower edge of the rail. To remove the time relay, press it downward to release the tension of the spring, and the time relay can be removed.

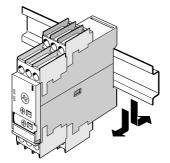

Figure 7-19: Rail mounting

**Screw-on attachment** Screw-on attachment is possible by means of push-in lugs for M4 screws (application, see under Section 7.4 Accessories)

#### 7.5.2 Connection

The 3RP10 solid-state time relays are available with SIGUT<sup>®</sup> terminals with plus/minus Pozidriv 2 screws and also with Cage Clamp terminals. The 3RP15 solid-state time relays are available:

- With SIGUT<sup>®</sup> terminals with plus/minus Pozidriv 2 screws
- With Cage Clamp terminals

Conductor cross-sec-<br/>tionsThe following table lists the permissible conductor cross-sections for the<br/>3RP1 solid-state time relays. The specifications apply to control and load<br/>current connections.

	3RP10.0-1	3RP10.0-2 (Cage Clamp)	3RP15	3RP152 (Cage Clamp)
Ø 5 to 6 mm / PZ2	0.8 to 1.2 Nm 7 to 10.3 lb.in		0.8 to 1.2 Nm 7 to 10.3 lb.in	
	2 x (0.5 to 1.5 mm²) 2 x (0.75 to 4 mm²)	2 x (0.25 to 2.5 mm <sup>2</sup> )	1 x (0.5 to 4 mm <sup>2</sup> ) 2 x (0.5 to 2.5 mm <sup>2</sup> )	2 x (0.25 to 1.5 mm <sup>2</sup> )
	2 x (0.5 to 2.5 mm²)	2 x (0.25 to 1 mm²)	1 x (0.5 to 2.5 mm <sup>2</sup> ) 2 x (0.5 to 1.5 mm <sup>2</sup> )	2 x (0.25 to 1 mm²)
		2 x (0.25 to 1.5 mm²)		2 x (0.25 to 1.5 mm²)
AWG	2 x (18 to 14)	2 x (24 to 14)	2 x (20 to 14)	2 x (24 to 16)

## 8.1 Specifications/regulations/approvals

The 3RW3 semiconductor motor control units, referred to below more succinctly as soft starters, meet the UL and CSA requirements.

UL/CSA	UL 508
Degrees of protection offered by housings	EN
DIN standard rail	EN 50 022
Electronic Motor control units	IEC 60947 - 4-2
Shock protection	IEC 60947 - 1 and DIN 40050
EMC	IEC 60801 - 4 -2 (draft)
General specifications	EN 602 69 - 1A1
Control devices and switching elements	EN 602 69 - 1A1
Gost	Approved by Gost
CTic	EMC compliance marking for Australia (similar to CE marking)

Table 8-1: Standards, certificates, and approvals, 3RW3

Normal switching duty The 3RW3 soft starters can be used for normal switching duty in acc. with DIN VDE 0100 Part 460: A switch for normal switching duty must be provided for all circuits that are to be switched independently of other parts. Switches for normal switching

duty do not necessarily all switch active conductors of a circuit.

IsolationThe soft starters do not meet the requirements for isolation<br/>in acc. with DIN VDE 0100 Part 460 and EN 60 947-1:<br/>Every circuit must be capable of being isolated from the active conductors<br/>of the power supply.<br/>Circuit groups can be isolated by a common device if this is permitted by the<br/>operating conditions. In the open position, devices with an isolating function<br/>must have a corresponding isolating distance and an indicator showing the<br/>positions of the moving contacts.

## Warnings

## Caution

The devices are all carefully tested at the factory and are not shipped unless they are found to be in proper working order. However, they may be subjected to stresses during transportation over which we have no control.

Consequently, the impulse series relays in the main circuit may be in an undefined switching state.

In the interests of complete safety, the following procedure should be used at commissioning or after the replacement of the SIRIUS soft starter:

**First**, apply the supply voltage in order to put the impulse series relays in a defined switching state.

Then, switch the main circuit on.

If you deviate from this procedure, the motor can be switched on inadvertently and cause damage to people or parts of the system.

## Important

/Ì/

The 3RW3...-1.B1. soft starter was built as a class A device. Using this product in residential buildings could cause radio interference.

## 8.2 Device description

The SIRIUS 3RW3 soft starters are part of the SIRIUS modular system. They are compatible with the other SIRIUS switching devices.

The possible combinations are:

- 3RW3 soft starter + 3RV circuit breaker
- 3RW3 soft starter + 3RU/3RB overload relay + 3RT contactor

The link modules used for combinations of contactors and circuit breakers are used for this (see Section 8.3.2, "Installation guidelines").

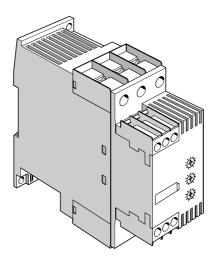

Figure 8-1: 3RW3 soft starter

#### 3RW30/31 frame sizes

The 3RW30 soft starter is available in four frame sizes: S00, S0, S2, and S3. The 3RW31 soft starter is available in frame size S0.

The following table contains the power ranges of the various frame sizes (all specifications apply to  $\rm U_N$  = 400 V and 40° C ambient temperature):

Frame size S00	Frame size S0	Frame size S2	Frame size S3
1.1 - 4 kW	5.5 - 11 kW	15 - 22 kW	30 - 55 kW
6 - 9 A	12.5 - 25 A	32 - 45 A	63 - 100 A
(W x H x D) (mm) 45 x 97.5 x 93	(W x H x D) (mm) 45x125x119	(W x H x D) (mm) 55 x 160 x 143	(W x H x D) (mm) 70x170x178

Table 8-2: 3RW3, frame sizes

#### 8.2.1 Physical principles

#### **Starting current**

Three-phase current asynchronous motors have a high inrush current  $I_{(star-ting)}$ . This inrush current can be between three and fifteen times as high as the rated operational current, depending on the type of motor. A figure between seven and eight times the rated operational current can be postulated as typical.

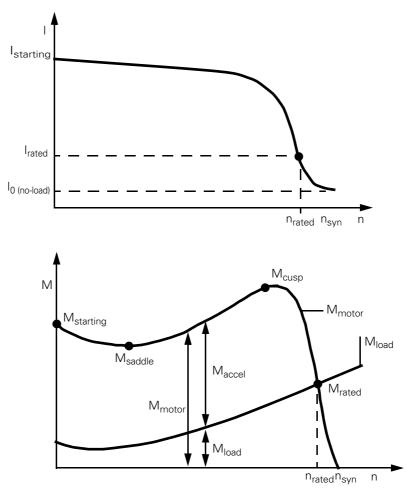

Figure 8-1: Typical current and torque curve of a three-phase asynchronous motor

#### Important

This starting current must be taken into consideration in the design of the supply network, among other things by adapting the supply (high heat development) and the fusing (inadvertent tripping of the fuses).

# Reducing the starting current

There are various ways of reducing the starting current:

- By star-delta starter
- By frequency converter
- By soft starter

**Star-delta starter** After a delay, the motor windings are switched from a star to a delta configuration. The motor current for star starting is only about 1/3 of that required for delta starting (motor torque, too, is reduced to approximately 1/3 of the delta torque).

#### **Disadvantages:**

- 6 motor cables are necessary
- Switching surges occur (in the current and torque transients)
- The startup cannot be adapted to the system environment
- Installation is relatively complicated and time-consuming
- More space is needed in the cubicle

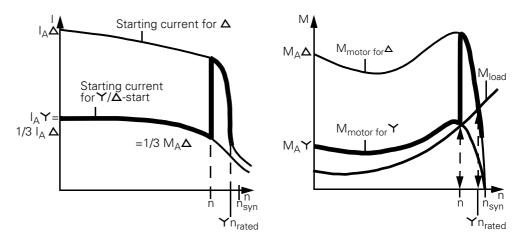

Figure 8-2: Current and torque curves for star-delta starting

#### Frequency converter

A frequency converter converts the AC voltage from the grid to direct voltage, which can then be converted to any voltage and frequency. The illustration below shows how a frequency converter works:

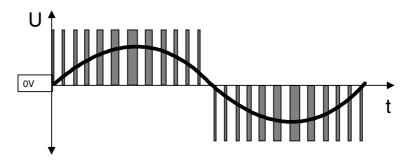

Figure 8-3: Method of operation of a frequency converter

#### **Disadvantages:**

- Relatively complicated wiring needed in order to meet radio interference suppression requirements; filters are often essential
- Line capacitances limit the lengths of motor feeder cables; it may be necessary to use chokes, sinus filters, or even dV/dt filters.
- Expensive
- System startup is complex and time-consuming on account of the multiplicity of operating parameters
- It can be necessary to use shielded motor feeder cables

#### Advantages:

• Motor speed is variable; speed can be accurately pegged at constant levels.

The U/f ratio remains virtually constant. It is therefore possible to achieve high torques at relatively low currents.

# **Soft starter** With a soft starter, motor voltage is increased from a selectable starting voltage to the rated voltage by phase firing within a defined starting time. Motor current is proportional to the motor voltage, so the starting current is reduced by the factor of the defined starting voltage. The illustration below shows how the 3RW3 soft starter works:

 $U_{L1-L3}$ 

Figure 8-4: Phase firing of the supply voltage by semiconductor elements in the 3RW3 soft starter

#### Example:

Starting voltage 50% of  $U_e =>$  starting current equals 50% of the motor starting current for direct-on-line starting.

A soft starter also reduces motor torque. This is the reason why a softstarted motor does not jerk into action.

The relationship is as follows: The motor torque is proportional to the square of the motor voltage.

#### Example:

Starting voltage 50% of U<sub>e</sub> => starting torque 25% of the starting torque for direct-on-line starting.

#### Advantages:

- Less space needed in the cubicle
- No protective circuits (e.g. filters) necessary to comply with the radio interference suppression specifications (class A; in UC 24 V control voltage version also class B)
- Lower installation costs
- Straightforward system startup
- Only 3 motor feeder cables, half as many as are needed for a star-delta starter
- Adjustment options permit adaptation to the system.

#### **Disadvantages:**

- Long-term speed settings not possible.
- Lower torque at reduced voltage

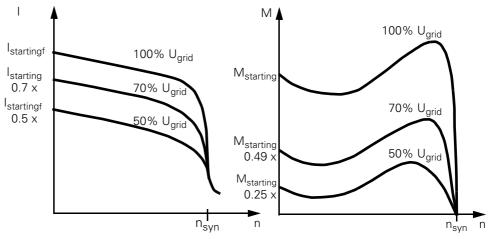

Figure 8-5: Current and torque curves for a soft starter

#### 8.2.2 General device description

The SIRIUS modular system offers a variety of alternatives for load feeders. In addition to the star-delta starters (see Chapter 5, "3RA fuseless load feeders"), the SIRIUS 3RW3 soft starters are also available.

The 3RW3 soft starters can be combined with the following SIRIUS devices:

- 3RT contactors
- 3RV circuit breakers
- 3RU thermal overload relays
- 3RB10 electronic overload relays

They are all mounted and connected up in the same way. Please note the relevant guidelines in Section 8.3.2.

#### Functions of the load feeder

Normal switching<br/>dutyNormal switching duty of a circuit can, according to the definitions of isola-<br/>tion and normal switching data in DIN VDE 0100 (see Section 8.1), be imple-<br/>mented with a contactor or a soft starter alone.

Isolation	According to DIN VDE 0100, isolation from the supplying network cannot be provided by a semiconductor element (i.e. soft starter, frequency converter, contactor, or similar). To implement isolation from the supplying network, a 3RV circuit breaker (or another isolating device that fulfills the requirements of DIN VDE 0100) must be used in addition to the contactor or soft starter. A contactor alone in combination with the soft starter is not enough. Both isolation and normal switching duty can be implemented quickly and easily with the 3RW3 soft starter in combination with the modules from the SIRIUS modular system.
Variants	The electronic soft starters are available in two variants:
	<b>Standard 3RW30 variant</b> The standard 3RW30 variant is used for single-speed motors. This variant is available in all four frame sizes. The starting voltage $U_s$ , starting time $t_{Ron}$ , and coasting-down time $t_{Roff}$ can be set independently of each other on the device. The device is switched on by means of a cycling contact IN.
	<ul> <li><b>3RW31 special variant</b></li> <li>The 3RW31 special variant cycles pole-changing motors (Dahlander winding). The following can be set independently of each other:</li> <li>Starting voltage U<sub>s</sub></li> <li>Starting time of initial speed t<sub>R1</sub></li> <li>Starting time of second speed t<sub>R2</sub></li> <li>The device does not have a coasting-down function. The set starting voltage applies to both ramp times t<sub>R1</sub> and t<sub>R2</sub>.</li> <li>The ramp time is selected by means of two inputs, IN1 and IN2, that switch the soft starter on.</li> <li>The devices of the 3RW31 series are only available in frame size S0.</li> </ul>
Settings	<ul> <li>The devices can be set as follows:</li> <li><b>3RW30</b></li> <li>By means of 3 potentiometers for setting:</li> <li>Starting time in the range from 0 to 20 seconds</li> <li>Starting voltage in the range from approx. 30 to 100% of the rated voltage of the motor</li> <li>Coasting-down time in the range from 0 to 20 seconds</li> </ul>
	<ul> <li>3RW31</li> <li>By means of 3 potentiometers for setting:</li> <li>Starting time 1 in the range from 0 to 20 seconds</li> <li>Starting voltage in the range from approx. 30 to 100% of the rated voltage of the motor</li> <li>Starting time 2 in the range from 0 to 20 seconds</li> <li>A special software program ensures that progressive ramp times are set. Short times of up to 5 seconds can thus be set very precisely.</li> </ul>

Auxiliary contacts	<ul> <li><b>3RW30</b></li> <li>In the case of frame sizes S0 to S3, the following auxiliary contacts are integrated:</li> <li>"ON": When triggered, the latching signal is used for locking by means of a simple on/off pushbutton (contact designation 13/14).</li> <li>"BYPASSED": With the end-of-startup signal, control valves can be addressed after soft starting of a pump, for example, in order to enable pumping (contact designation 23/24).</li> </ul>
	The devices of frame size S00 do not have any auxiliary switches.
	<b>3RW31</b> The 3RW31 does not have any auxiliary contacts.
Soft starting function	Torque-reduced start for three-phase asynchronous motors: Triggering is two-phase, which means that the current is kept low through- out the run-up phase. Current peaks such as those that occur in a star-delta start at the changeover from star to delta are prevented by continuous volt- age management. Transient current peaks (inrush peaks) are automatically avoided in each switch-on procedure by a special control function of the power semiconduc- tors.
Soft coasting-down function	The integrated soft coasting-down function prevents the drive coming to an abrupt halt when the motor is switched off.

3RW30 time ramps

The following graphics show the time ramp of the 3RW30 and the timing diagram of the auxiliary contacts:

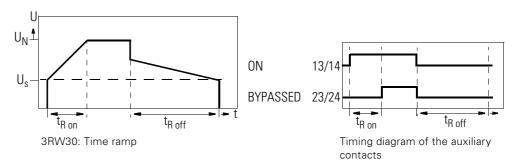

Figure 8-6: Time ramp/timing diagram, 3RW30

The graphic below shows the time ramp of the 3RW3:

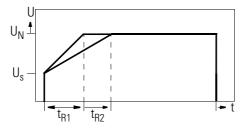

Figure 8-7: Time ramp, 3RW31

Accessories	<ul> <li>A fan can be snapped into the soft starter housing of frame sizes S0 to S3 from below. This brings the following benefits:</li> <li>Improved range of options for the installation position</li> <li>Increase in the switching frequency (see Section 8.3.2, "Installation guide-lines")</li> </ul>
	In the case of frame sizes S0 and S2, extended terminal covers can be mounted on the box covers in order to cover the cable ends and keep them safe from fingers. These are identical to the extended terminal covers of the SIRIUS 3RT contactors of the same frame sizes. In the case of frame size S3, terminal covers are available for lug connection or bar connection. These, too, are identical to the accessory parts of the cor- responding SIRIUS contactor size. See Section 8.4 for details of other accessories.
Mounting	The devices are attached to the 3RV circuit breakers by means of a link mod- ule and are thus connected mechanically and electrically. This link module is identical to the one that is used for the corresponding contactor/circuit- breaker combinations. This installation variant offers all the advantages of a fuseless load feeder.

Link modulesThe following link modules are used to combine 3RW3 soft starters and<br/>3RV1 circuit breakers:

Frame size	Link module
S00	3RA1911-1A
SO	3RA1921-1A
S2	3RA1931-1A
S3	3RA1941-1A

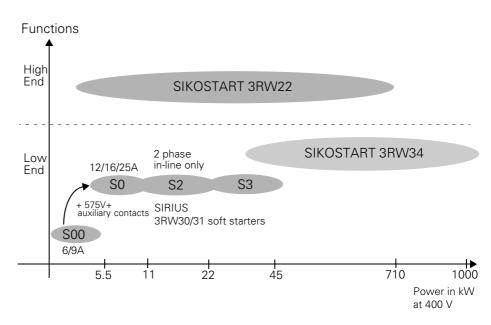

Table 8-3: Link modules

#### Connection

The 3RW3 electronic soft starters are available with screw-type terminals. Plus-minus POZIDRIV 2 screws are used.

The SIGUT terminal system is used (captive screws, contacts open on delivery, etc.).

# 8.2.3 Comparison of the 3RW3 semiconductor motor control unit (soft starter) with the SIKOSTART 3RW22 and SIKOSTART 3RW34 motor control units

Soft starters are available for different applications. The following graphic provides an overview of the different soft starters:

Figure 8-8: Overview of soft starters

**SIKOSTART 3RW22** The SIKOSTART 3RW22 is suitable for drives that place high demands on the functionality of the starter. It covers a power range from 3 kW to 710 kW (at 400 V).

SIKOSTART 3RW22 offers the following:

- Soft starting and soft coasting down
- Break-loose torque
- DC brakes
- Energy-saving operation
- Temperature monitoring
- Operation using a PC and an RS232 interface
- Selection and configuration program
- Current and voltage limitation
- Pump functionalities (e.g. pump coasting down)
- Startup detection
- Three parameter sets
- Different coasting-down types
- Electronic device overload protection

The SIKOSTART 3RW22 application manual presents the various application areas and circuit variants (order no. E20001-P285-A484-V3).

SIKOSTART 3RW34	<ul> <li>The SIKOSTART 3RW34 is suitable for drives with low demands in terms of the functionality of the soft starter. The SIKOSTART 3RW34 is very similar to the SIRIUS 3RW3 soft starter in terms of its operation and configuration. It covers a power range of up to 1000 kW (400 V).</li> <li>The functions of the 3RW34 are as follows:</li> <li>Soft starting and soft coasting down</li> <li>2 circuit variants: standard and root 3 circuits</li> <li>Three-phase control</li> <li>Optional AS-i bus control</li> <li>You will find the technical specifications and a detailed description of the</li> </ul>
	3RW34 in the document describing SIKOSTART 3RW22/3RW34 solid-state motor controllers (order no.: E20001-A200-P302).
SIRIUS 3RW3 soft starter	<ul> <li>The SIRIUS 3RW3 soft starter covers the power range from 1.5 kW to 45 kW.</li> <li>Power semiconductors always exhibit power loss. This manifests itself in heat generation. In order to keep this power loss as low as possible, the semiconductors are bypassed by relay contacts after the motor has started up. The device's heat sink and its dimensions can thus be smaller than they otherwise would be. In addition, it is necessary to use a bypass contactor, which bypasses the line semiconductors in the conventional configuration. For further processing in the system controller, the device offers two relay outputs:</li> <li>"ON" contact (terminals 13/14), which can be used, for example, to control the soft starter by button (locking)</li> <li>"BYPASSED" contact (terminals 23/24), which signals the completion of startup (e.g. in order to switch a solenoid valve after a soft-started pump has started up)</li> </ul>
	For drives in this power range, good motor startups can be achieved with a two-phase controller. In the case of a two-phase controller, semiconductor elements are only

In the case of a two-phase controller, semiconductor elements are only used in two phases in order to reduce motor current and motor voltage in all three phases. The third phase is bypassed internally in the soft starter.

# 8.2.4 Comparison of the 3RW3 semiconductor motor control unit (soft starter) with the 3RA star-delta combination

The comparison of soft starter and star-delta combinations shows that the 3RW3 has the following advantages (example here 22 kW):

3RW3 soft starter	3RA star-delta starter
Width: 55 mm	Width: 165 mm
Wiring: 3 motor supply leads	Wiring: 6 motor supply leads
Selectable startup parameters	None
Minimum current values at startup	Fixed current ratios $(I_{\Upsilon} = 1/3I_{\Delta})$
No dangerous switchover current peaks	Switchover current peaks when switching from star to delta
Special variant for Dahlander motors	
Soft coasting-down function	

Table 8-4: Comparison of 3RW3/3RA

#### 8.2.5 Notes on configuration

	In order for a motor to reach its rated speed, motor torque at any given time during startup must be greater than the torque needed by the load, since otherwise a stable operating point would be reached before the motor achieved its rated speed (the motor would "drag to a stop"). The difference between motor torque and load torque is the accelerating torque that is responsible for the increase in the speed of the drive. The lower the acceler- ating torque, the longer the motor needs to run up to its operating speed.
Starting torque	Reducing the terminal voltage of a three-phase asynchronous motor reduces the motor's starting current and the starting torque. Current is directly proportional to voltage, whereas voltage is proportional to the square root of motor torque.
	<ul> <li>Example: Motor = 55 kW, rated current = 100 A, starting current = 7 x rating current, motor torque = 355 Nm, starting torque = 2.4 x rated torque Settings for the soft starter: starting voltage 50% of rated voltage for motor The reductions are thus as follows:</li> <li>The starting current is reduced to half the starting current for a direct start: 50% of (7 x 100 A) = 350 A</li> <li>Starting torque is reduced to 0.5 x 0.5 = 25% of the starting torque for a direct start: 25% of 2.4 x 355 Nm = 213 Nm</li> </ul>
Note	On account of the fact that the starting voltage is proportional to the square root of the motor torque, it is important to ensure that the starting voltage is not too low. This applies particularly for a pronounced saddle torque, the lowest motor torque that occurs during run-up to rated speed.
	lowest motor torque that occurs during run-up to rated speed.

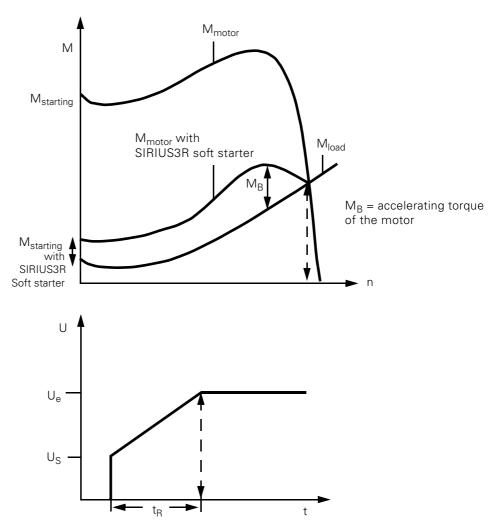

Figure 8-9: Load and motor torques and motor terminal voltage for operation with soft starter

**Criteria for selection** 

#### Note

In the case of the SIRIUS 3RW30/31 soft starters, the corresponding soft starter must be selected on the basis of the rated current for the motor (the rated current of the soft starter must be  $\geq$  the rated current for the motor).

The 3 potentiometers on the starter are for setting the starting voltage, the starting time, and the coasting-down time.

The soft starter is correctly set when the motor starts smoothly and runs up rapidly to its rated speed.

Ramp times of up to 20 seconds can be set.

## 8.3 Application and use

#### 8.3.1 Areas of application and criteria for selection

	The SIRIUS 3RW3 soft starters offer an alternative to star-delta starters (see Section 8.2.4 for a comparison and the advantages). The most important advantages are soft starting and soft coasting-down, interruption-free switching without current spikes that could interfere with the supply system, and compact dimensions. Many drives that needed frequency converters in the past can be changed to soft-start operation with the 3RW3, if the applications do not call for vari- ations in speed.
Applications	Typical applications include, for example:
	Conveyor belts, conveyor systems: • Smooth starting • Smooth slowing • Use of better-value conveyor material
	<ul><li>Rotary pumps, piston-type pumps</li><li>Avoidance of pressure surges</li><li>Extended service life of the piping system</li></ul>
	Agitators, mixers: • Reduced starting current
	<ul><li>Fans:</li><li>Less strain on gearing and drive belts</li></ul>
Cooling time	<b>Note:</b> The cooling time must be taken into consideration in the starting frequency.

#### 8.3.2 Installation guidelines

On account of the heat generated, certain installation guidelines must be adhered to when combining 3RW30/31 soft starters with other SIRIUS switching devices.

Stand-alone installa-<br/>tionStand-alone installation is when minimum vertical and lateral clearances<br/>between the mounted devices are not violated. This applies both to indivi-<br/>dual devices and complete load feeders.<br/>The following minimum clearances must be adhered to in stand-alone instal-<br/>lation (these minimum clearances depend on the frame size):

Frame size	Minimum clearance on both sides in mm
S00	15
SO	20
S2	30
S3	40

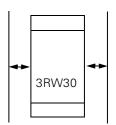

Table 8-5: Stand-alone installation, minimum clearances at the side, 3RW3

			а
Frame size	Vertical clearance a	Vertical clearance b	
S00	50	50	
S0	60	40	3RW30
S2	50	30	
S3	60	30	b

Table 8-6: Stand-alone installation, minimum clearances at the side, 3RW3

# Line lengths for the drive circuit

The control inputs for starting and stopping are not rated for longer distances. This means:

- In the case of a drive circuit that goes beyond the control cubicle, coupling relays must be used.
- The control cables in the cubicle should not be laid together with main circuit cables.

When electronic output modules are used in the drive circuit (e.g. Triac outputs at 230 VAC), RC elements (e.g. 3TX7462-3T or similar with C > 100 nF) may be required at the control inputs under certain circumstances.

Correction factors	<ul> <li>If the minimum clearances are violated, in a combination of a soft starter with a circuit breaker, fixed correction factors must be used to determine the rated current for the device and the switching frequency.</li> <li>The following variables can be modified by means of correction factors:</li> <li>Rated current for the device</li> <li>Switching frequency</li> <li>Current setting of the circuit breaker</li> <li>Current setting of the overload relay</li> </ul>
Correction factor for the rated current of the	A factor is specified by which the device rated current of the soft starter is reduced.
device	<b>Example:</b> Correction factor for the rated current of the device = $0.9$ Selected device = 3RW3014-1CB14 (under normal conditions at 40 °C a device rated current of 6 A) This results in an actual device rated current of: $0.9 \times 6 A = 5.4 A$
Correction factor for switching frequency	The switching frequency is the maximum permissible number of starts per hour. This value must be adjusted by the specified correction factor. The number of permissible starts per hour is given in Table 8.7.1, Control electro- nics/power electronics, in Section 8.7, Technical specifications. The specified correction factors refer to the following operating conditions: S4 operation, 40 °C ambient temperature, 30% duty cycle
	<b>Example:</b> Correction factor for the switching frequency = 1.5 Selected device = 3RW3014-1CB14 (has a maximum switching frequency of 30 starts per hour under the conditions specified above) This results in a corrected switching frequency of: 1.5 x 30 = 45 starts per hour
	To increase the switching frequency, it is also possible to use a larger device.
Correction factor for the current setting of the circuit breaker	In combinations of a 3RW30 soft starter and a 3RV1 circuit breaker, the set value of the circuit breaker may have to be corrected appropriately. The correction factor specifies the extent of the change.
	<b>Example:</b> Correction for the current setting of the circuit breaker: 1.1 Selected device = $3RW3014-1CB14$ The connected motor has a motor rated current of 5 A. The set value of the circuit breaker must be changed to: 1.1 x 5 A = 5.5 A

Correction factor for the current setting of the overload relay	In combinations of a 3RW30 soft starter + 3RU1 thermal overload relay or 3RW30 software starter + 3RB10 electronic overload relay, the set value of the overload relay must be corrected appropriately. The correction factor specifies the extent of the change.			
	<b>Example:</b> Correction factor for the current setting of the overload relay 0.9 Selected device = 3RW3014-1CB14			

The connected motor has a motor rated current of 5 A.

The set value of the overload relay now has to be changed to: 0.9 x 5 A = 4.5 A

#### 8.3.3 Overview tables: correction factors

The tables below give the correction factors for the circuit-breaker current setting, the device rated current, and the switching frequency. The values indicate the difference between use with a fan (accessory) and use without a fan. All correction fans apply throughout the entire temperature range (i.e. for 40 °C, 50 °C, and 60 °C). The various tables specify the values in turn for the following: 3RW30/31 soft starters in a stand-alone installation 3RW30/31 soft starter + 3RV1 circuit breaker 3RW30/31 soft starter + 3RT1 contactor + 3RU1 thermal overload relay 3RW30/31 soft starter + 3RT1 contactor + 3RB10 electronic overload relay

#### 8.3.3.1 3RW30/31 soft starters in a stand-alone installation

# Minimum clearanceIn the case of frame size S00 (3RW301..), the following applies to stand-<br/>alone, vertical installation without directly attached switching devices:<br/>In order to maintain the required space above the arc chute, clearance of at<br/>least 50 mm must be maintained to grounded parts above and below.

3RW30/31 correction

factors

Table 8-8: Correction factors: 3RV1 circuit breaker + 3RW3 soft starter

#### 8.3.3.3 Combining the 3RT contactor with the 3RU1 thermal overload relay and 3RW3 soft starter

Frame size of the<br/>overload relayThe frame size selected for the overload relay should be large enough so<br/>that it is just possible to set the current value calculated.<br/>In the event of current values that are lower than can be set for the speci-<br/>fied overload relay, the next smaller overload relay must be used.

#### Important

It is not permissible to mount the thermal overload relay under the contactor/connecting lead/soft starter combination.

The overload relay must be integrated in the feeder before the contractor/ connecting lead/soft starter combination. The specified correction factors apply only to this permissible mounting sequence.

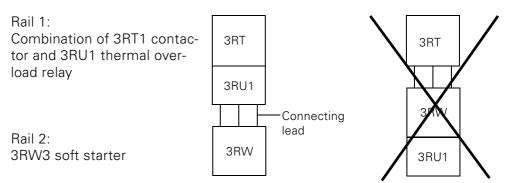

Figure 8-11: 3RT+3RU1+3RW3 combination

#### Minimum clearance

For thermal reasons, a minimum clearance is necessary between the contactor/overload relay combination and the soft starter, as is a minimum length of the connecting leads.

The following table specifies the minimum clearances and minimum lengths of the connecting leads for the various frame sizes:

Frame size	Minimum clearance bet- ween rail 1 and rail 2 (center to center) in mm	Minimum length of the connecting lead in mm
S00	160	100
S0	200	150
S2	240	200
S3	300	250

Table 8-9: 3RW3 installation guidelines, minimum clearances/lengths

#### Correction factors: 3RT + 3RU1 + 3RW30/31

# 8.3.3.4 Combining the 3RT contactor with the 3RB10 electronic overload relay and 3RW3 soft starter

The contactor, electronic overload relay, and soft starter can be connected in two ways:

- Combining a 3RT1 contactor with an attached 3 RB10 electronic overload relay, a connecting lead, and a 3RW30/31 soft starter
- Combining a 3RT1 contactor with a connecting lead and a combination of a 3RW30/01 soft starter with an attached 3RB10 electronic overload relay

3RT + 3RB10 + connect- ing lead + 3RW3	Rail 1: Combination of a 3RT1 contactor and a 3RB10 electronic overload relay	3RT	
	Rail 2:	3RB10	Connecting
	3RW30/31 soft starter	3RW	lead

Figure 8-12: 3RT+3RB10+3RW3 combination

**Minimum clearance** For thermal reasons, a minimum clearance is necessary between the contactor/overload relay combination and the soft starter, as is a minimum length of the connecting leads.

The following table specifies the minimum clearances and minimum lengths of the connecting leads for the various frame sizes:

Frame size	Minimum clearance between rail 1 and rail 2 (center to center) in mm	Minimum length of the connecting lead in mm
S00	160	100
S0	200	150
S2	240	200
S3	300	250

#### 8.3.4 Circuit example

Circuit example (variant with UC110-230 V):

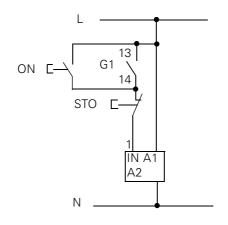

Figure 8-14: Circuit example, 3RW3

#### 8.3.5 Commissioning

Every SIRIUS 3RW soft starter comes with the following warning, which it is imperative to heed:

#### Caution

This device has been tested carefully at the factory and found to be in working order.

During transportation, however, it may have been subject to stresses over which we have no control. The bypass relays in the main circuit may be in an undefined state.

In the interests of complete safety, the following procedure should be used at commissioning or after the replacement of the SIRIUS soft starter:

**First**, apply the supply voltage to A1/A2 in order to put the impulse series relays in a defined switching state.

Then, switch on the main circuit (L1/L2/L3).

If you do not do this, the motor can be switched on inadvertently and cause damage to people or parts of the system.

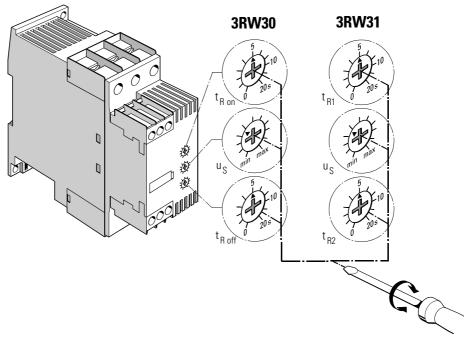

Figure 8-15: Settings, 3RW3

#### Note

At commissioning, the settings of the potentiometers for the ramp time and the starting voltage should remain unchanged. These set values must be obtained in a trial.

## Settings

Changing settings	The potentiometer settings are scanned before each switching operation ("ON" or "OFF"). If, for example, the setting of the potentiometer for starting time is changed while the motor is running up, the change does not come into effect until the next start.
Starting voltage	The starting voltage should be set to a value at which the motor starts rap- idly.
Ramp time	The ramp time should be set such that the motor can run up within the time defined in this way. If the star time for star-delta starting is known, the ramp time can be set to this value.
Coasting-down time	The potentiometer for the coasting-down time is for setting the duration of the voltage ramp for coasting down. This parameter can be used to make the motor run-down longer than it would be if the motor were merely to coast to a stop. The motor coasts to a stop on its own if this potentiometer is set to a value of 0.
Switching frequency	To prevent thermal overloading of the devices, the maximum permissible switching frequency must be adhered to and the correction factor tables must be used (see the installation guidelines in Section 8.3.2).
Starting time	In order to obtain optimum operating conditions for the 3RW3 soft starter, the setting for the starting time should be approx. 1 second longer than the resultant motor run-up time, in order to ensure that the internal jumpering contacts do not have to carry the starting current. This protects the internal jumpering contacts and increases their service life. Longer starting times increase the thermal load on the devices and the motor unnecessarily and lead to a reduction in the permissible switching frequency.

Position of the terminals

#### 3RW30

The following graphic illustrates the position of the terminals and the potentiometers for adjustment.

Frame size S0 to S3

3RW302./303./304.

Frame size S00 3RW301.

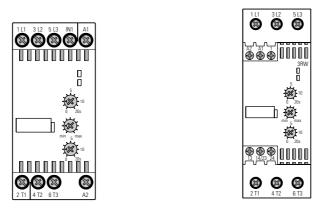

Figure 8-16: Position of the terminals and the potentiometers for adjustment

#### 3RW31

The 3RW31 soft starters are available in frame size S0. Outwardly, they differ from the 3RW30 in the labeling of the contacts and the terminals:

- There is no BYPASSED auxiliary contact. The free contact is used to enable the necessary drive contact IN2 to switch between the ramp times  $t_{B1}$  and  $t_{B2}$ .
- The 3RW31 does not have a coasting-down ramp. The potentiometer with which the coasting-down time is adjusted on the 3RW30 is used here to set the second ramp time  $t_{R2}$ .
- There is no ON auxiliary contact.

#### Line length of the control cable

To eliminate problems with the cable coupler capacitances, the control cable should be shorter than 15 m. (This is based on devices with a rated control supply voltage of UC 24 V to 50 m.)

To eliminate problems in control cables that are fed out of the cubicle, coupling links must be used.

#### 8.3.6 Event messages and diagnostics

#### Event messages

READY LED	Continuous Flashing	Ready for operation while starting up or coasting down
BYPASSED LED	Continuous	Bypassed

Table 8-14: 3RW30/31 event messages

Malfunction	Possible cause	Remedy
READY LED off	Supply voltage too low	<ul> <li>Check and adapt the supply voltage at A1, A2</li> </ul>
	<ul> <li>No supply voltage</li> </ul>	<ul> <li>Check fuses/line contactor</li> </ul>
No reaction to con- trol input IN	Phase loss	<ul><li>Check fuses/line contactor</li><li>Check voltages at L1 to L3</li></ul>
(READY LED on)	Wrong cable connected to IN	<ul> <li>Connect to IN as shown in the graphic of the terminals</li> </ul>
	No load	Connect the motor
Start the motor directly (BYPASSED LED on)	<ul> <li>The line voltage is switched off and on in continuous operation without operation of the con- trol input IN</li> </ul>	<ul> <li>Always switch the line contactor off and on in conjunction with control input IN</li> </ul>

## Diagnostics

Table 8-15: 3RW30/31 diagnostics

#### 8.3.7 Timing diagram

down behavior

The following timing diagram shows the switchover times when the device Starting and coastingis switched on/off:

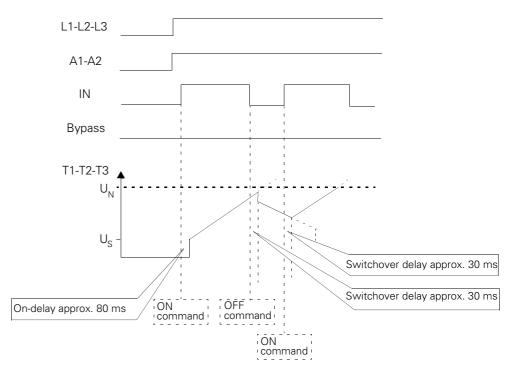

Figure 8-17: Starting and coasting-down behavior

# Supply interruption in bypassed state

If the load voltage is switched off in the bypassed state while the auxiliary supply continues to be applied at terminals A1/A2, the soft starter performs a direct start of the motor after the load voltage is switched on again. To prevent this, the "on" command must be removed in the event of the loss of the main voltage.

The following graphic illustrates what happens when the supply is interrupted in the bypassed state:

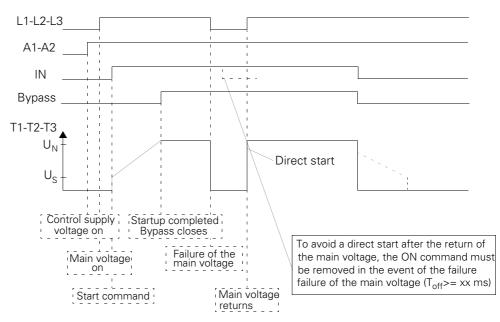

Figure 8-18: Supply interruption in the bypassed state

# 8.4 Accessories

The following accessories are available for the 3RW3 soft starters:

Description	Order number
Fan for 3RW3.2	3RW3926-8A
Fan for 3RW303 and 3RW304	3RW3936-8A
Terminal covers for box covers for 3RW303	3RT1936-4EA2
Terminal covers for box covers for 3RW304	3RT1946-4EA2
Terminal cover for bar connection for 3RW304	3RT1946-4EA1
Link modules for combination with 3RV1 circuit breaker	3RA19.1-1A (frame sizes S00 to S3)
RC element for control from PLC	3TX7462-3T

Table 8-16: Accessories, 3RW30/31

 Control of the fan
 The fan is controlled by the control electronics of the soft starter. It runs at the following times:

 When the fan is switched on: approx. 0.5 seconds after the bypass contacts close (end-of-startup signal)
 When the fan is switched off: approx. 0.5 hours after the soft starter is switched off

 Attachment of the fan
 The fan is snapped into the recess provided on the underside of the soft starter, and the plug-in cable is inserted in the corresponding connector. The direction of installation is indicated on the fan by an arrow. Additional parameter assignment is not necessary. These fan modules mean that the starter can be installed in any position. The only exception to this is when the fan cannot blow against the convection downward from above.

#### Attachment of the fan

**Connection example for** 

an RC element

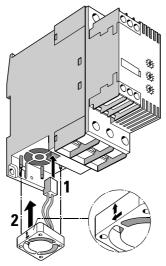

Figure 8-19: Accessories: attachment of the fan

**Terminal covers** To provide additional finger protection, for frame sizes S2 and S3 the terminal covers of the 3RT1 contactors of the same frame sizes can be used. Installation on the soft starter is analogous to that on the contactors.

Link modules The same link modules are available for building fuseless feeders (soft starter + 3RV circuit breaker) as are used for the 3RT contactor + 3RV circuit breaker combinations.

Refer to the information and assignment tables in Section 8.3.2, "Installation guidelines".

**RC element** If the 3RW30/31 soft starter is to be controlled from a PLC with a Triac or thyristor output, malfunctioning can be avoided with an RC element. If there is leakage current of more than 1 mA, without an RC element the soft starter may interpret the drop in voltage that occurs at the input as an "ON" command.

# Auxiliary supply

Figure 8-20: Connection example with an RC element

# 8.5 Mounting and connection

#### 8.5.1 Mounting

#### **Snap-on attachment**

The 3RW30 soft starters are snapped onto 35 mm rails in acc. with DIN EN 50 022 without a tool.

The starter is placed on the upper edge of the rail and pressed downward until it snaps onto the lower edge of the rail.

Frame sizes S00 and S0 can be removed just as easily: The starters are pressed downward so that the tension of the attachment springs is loosened, and the starters can be removed.

In the case of frame sizes S2 and S3, these attachment springs are released by a lug on the underside of the starter that can be moved using a screwdriver.

#### 8.5.2 Connection

**Screw-type terminals** The 3RW3 electronic soft starters are available with the SIGUT<sup>,</sup> terminal system and plus-minus POZIDRIV 2 screws.

Conductor cross-sec-<br/>tionsThe following table shows the permissible conductor cross-sections for the<br/>3RW30 electronic soft starters:

	3RW301. L1 L2 L3 A1/A2; N0/NC	3RW302. 3RW312. L1 L2 L3		3RW303. L1 L2 L3		3RW304 L1 L2 L3
Ø 5 6 mm / PZ2	0.8 to 1.2 Nm 7 to 10.3 lb.in	2 to 2.5 Nm 18 to 22 lb.in	Ø 5 6 mm / PZ2	3 to 4.5 Nm 27 to 40 lb.in	4	4 to 6 Nm 35 to 53 lb.in
	2 x (0.5 to 1.5 mm²) 2 x (0.75 to 2.5 mm²)	2 x (1 to 2.5 mm²) 2 x (2.5 to 6 mm²)		2 x (0.75 to 16 mm²)		2 x (2.5 to 16 mm²)
	2 x (0.5 to 2.5 mm²)	2 x (1 to 2.5 mm²) 2 x (2.5 to 6 mm²)		2 x (0.75 to 16 mm²) 1 x (0.75 to 25 mm²)		2 x (2.5 to 35 mm²) 1 x (2.5 to 50 mm²)
				2 x (0.75 to 25 mm²) 1 x (0.75 to 35 mm²)		2 x (10 to 50 mm²) 1 x (10 to 70 mm²)
AWG	2 x (18 to 14)	2 x (14 to 10)	AWG	2 x (18 to 3) 1 x (18 to 2)	AWG	2 x (10 to 1/0) 1 x (10 to 2/0)

Table 8-17: Conductor cross-sections, 3RW30/31

#### 8.5.3 Circuit diagrams

There are two ways to connect up the 3RW3 soft starter:

- Control by button and locking of the ON button via the "ON" auxiliary contact of the 3RW3
- Control by switch

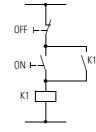

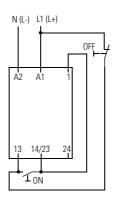

Figure 8-21: Circuit diagrams, 3RW3

#### L3RW30

#### 3RW302. 3RW303./3RW304

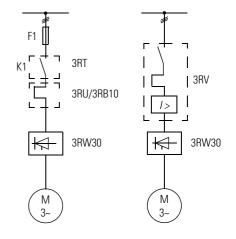

Figure 8-22: Circuit diagrams, 3RW30

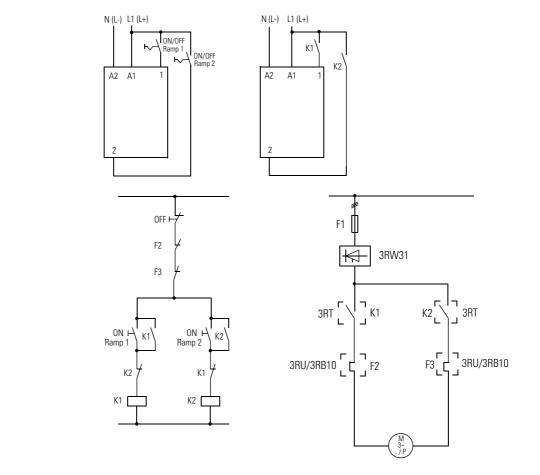

Figure 8-23: Circuit diagrams, 3RW31

#### **Automatic operation**

3RW31

Direct starting of the soft starter is possible as long as the auxiliary supply is applied at terminals A1 and A2. To this end, a jumper is required between the auxiliary supply contact A1 and the control contact IN. The following must be taken into consideration:

- An on delay of up to 4 seconds can occur, depending on the frame size.
- Soft coasting down is no longer possible after the auxiliary supply is switched off.

**Control via PLC** The 3RW3 soft starter can be controlled by means of a programmable controller (PLC). It is connected up in the same way as for control via switch.

#### Important

Always ensure that A1 and A2 are connected up correctly. Although polarity reversal cannot damage the device, it can lead to malfunctioning.

#### Control of a motor with an electromechanical brake

An electromechanical brake with infeed from the main voltage (L1/L2/L3) should not be connected directly to the output of the soft starter. An electromechanical brake should be controlled by means of a separate contactor (K1 in the circuit diagram below):

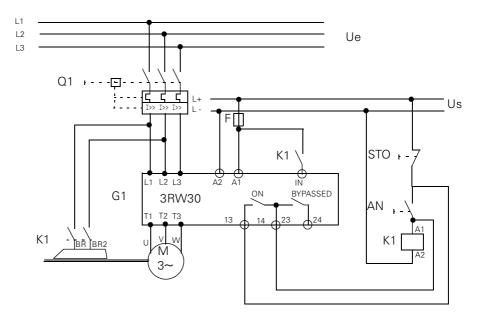

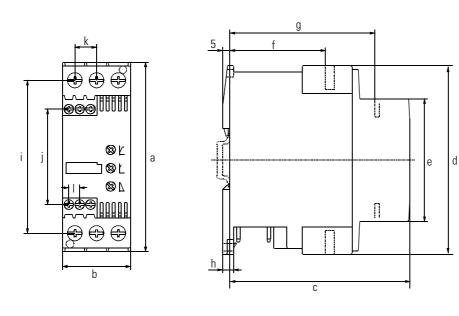

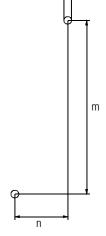

Figure 8-24: Motor control with an electromechanical brake

General specifications		
	Standard	Parameters
EMC noise immunity		
Electrostatic discharge (ESD)	IEC 1000-4-2,	Severity 3: 6/8 kV
El. magn. RF fields	IEC 1000-4-3	Frequency range: 80 to 1000 MHz with 80% at 1 kHz Severity 3, 10 V/m
Conducted RF disturbance	IEC 61000-4-6 EN 60 947-4-2 SN-IACS	Frequency range: 80 MHz to 1000 MHz with 80 % at 1 kHz 10 V at 0.15 MHz to 80 MHz 3 V at 10 kHz to 80 MHz
Burst	IEC 1000-4-4	Severity 3: 1/2 kV
Surge	IEC 1000-4-5	Severity 3: 1/2 kV
EMC emitted interference		
EMC radio interference intensity	CISPR 11/09.1990	Limit value of class B at 30 MHz to 1000 MHz
Radio interference voltage	CISPR 11/09.1990 EN 60 947-4-2	(0.15 MHz to 30 MHz): device class A (industry)

<sup>1</sup>) IP 20 only with attached box terminal (delivery state). Without box terminal IP 00.

<sup>2</sup>) Device class B (public power supply networks) is complied with only in the case of variants 3RW3.-1AB0. with control supply voltage UC of 24 V. For the 3RW3.-1A.1. variants with a control supply voltage UC of 110 V to 230 V, single-stage filters (e.g. type B84143-A...) must be connected upstream.

# 8.7.2 Short-circuit protection and fuse coordination

	IEC 60947-4-1/DIN VDE 0660 Part 102 draws a distinction between two coordination types, known as coordination type 1 and coordination type 2. In both coordination types, the short circuit to be dealt with is reliably disconnected. The differences lie only in the degree to which the device is damaged after a short circuit.
Coordination type 1	The motor feeder can be operable after each short-circuit disconnection. Damage to the soft starter is possible. The circuit breaker itself always attains coordination type 1.
Coordination type 2	After a short-circuit event there must be no damage to the soft starter or any other switching device; only the backup fuse may be destroyed. The actual motor feeder can be put into operation again immediately once the short circuit fuse has been replaced.
Maximum short-circuit current	All the specified fuse configurations are designed for a maximum short-cir- cuit current of 50 kA. This ensures that short circuits of 50 kA can be dis- connected without posing a threat to persons or the system.
Motor feeder: coordination type 1	Note on configuration A fuseless configuration is recommended for motor feeders (i.e. the combi- nation of a 3RV circuit breakers and a 3RW30 soft starter). Coordination type 1 is thus attained.
Motor feeder: coordination type 2	<ul> <li>To set up a motor feeder of coordination type 2, the feeder must be fused (i.e. the motor must be provided with overload protection).</li> <li>The following can be used:</li> <li>The 3NE1 all-range fuse, which unifies line protection and semiconductor protection</li> <li>The 3NE8 semiconductor protection fuse, in which case additional protec- tion must be provided for the line</li> </ul>
Comparison of coordi- nation types 1 and 2	<ul> <li>The configuration variant on the basis of coordination type 2 is associated with higher costs than that of coordination type 1, which is why the fuseless configuration (coordination type 1) is recommended. The advantages are:</li> <li>Fewer components in the cubicle</li> <li>Less effort required for wiring</li> <li>Less cubicle space required</li> <li>Lower price</li> </ul>

# Fuse configurations with SITOR 3NE1..-0

The following table specifies the fuse configuration (coordination type 2) for 3RW30/31 with SITOR fuses 3NE1..-0 (short-circuit and line protection); max. short-circuit current 50 kA:

Order number Soft starter	Order number of the fuse	Rated current of the fuse	Frame size of the fuse
MLFB	MLFB	А	
3RW3014	3NE1814-0 <sup>1)</sup>	20	000
3RW3016	3NE1815-0 <sup>1)</sup>	25	000
3RW3024/3RW3124	3NE1815-0 <sup>2)</sup>	25	000
3RW3025/3RW3125	3NE1815-0 <sup>2)</sup>	25	000
3RW3026/3RW3126	3NE1802-0 <sup>2)</sup>	40	000
3RW3034	3NE1818-0 <sup>2)</sup>	63	000
3RW3035	3NE1820-0 <sup>2)</sup>	80	000
3RW3036	3NE1820-0 <sup>2)</sup>	80	000
3RW3044	3NE1820-0 <sup>2)</sup>	80	000
3RW3045	3NE1021-0 <sup>2)</sup>	100	00
3RW3046	3)		

Table 8-18: Fuse configurations (SITOR)

1)Fuse coordination for max. 400 V

2)Fuse coordination for max. 500  ${\rm V}$ 

3)Fuse coordination with all-range fuses not possible; pure semiconductor protection fuses plus circuit breakers can be used instead (see following table)

# Fuse configurations with SITOR 3NE8

The following table specifies the fuse configuration (coordination type 2) for 3RW30/31 with SITOR fuses 3NE8 (semiconductor protection is provided by the fuse; line protection and overload protection are provided by the circuit breaker); max. short-circuit current 50 kA/400 V:

Order number Soft starter	Order number of the fuse	Rated cur- rent of the fuse	Frame size of the fuse	Order number of the circuit breaker <sup>2)</sup>	Link module 3RW - 3RV
MLFB	MLFB	А	Size	MLFB	MLFB <sup>3)</sup>
3RW3014	3NE8003	35	00	3RV1011	3RA1911-1A
3RW3016	3NE8003	35	00	3RV1011	3RA1911-1A
3RW3024/3RW3124	3NE8003	35	00	3RV1021	3RA1921-1A
3RW3025/3RW3125	3NE8003	35	00	3RV1021	3RA1921-1A
3RW3026/3RW3126	1)				
3RW3034	3NE8022	125	00	3RV1031	3RA1931-1A
3RW3035	3NE8024	160	00	3RV1031	3RA1931-1A
3RW3036	3NE8024	160	00	3RV1031	3RA1931-1A
3RW3044	3NE8024	160	00	3RV1041	3RA1941-1A
3RW3045	3NE8024	160	00	3RV1041	3RA1941-1A
3RW3046	3NE8024	160	00	3RV1041	3RA1941-1A

Table 8-19: Fuse configurations (SITOR)

- 1) Coordination with pure semiconductor protection fuses is not possible; all-range fuses 3NE1..-0 can be used (see the table above)
- 2) The selection and setting of the circuit breaker is based on the rated current for the motor
- 3) Note the unit of quantity

If the motor is to be configured to meet UL requirements, the order number of the fuse must be specified (3NE80..-1).

#### **Fuseless configuration**

The following table specifies the components of the fuseless configuration (coordination type 1) for 3RW30/31; short-circuit current of 50 kA/400 V:

Order number of the soft starter	Order number of the circuit breaker <sup>1)</sup>	Link module
MLFB	MLFB	MLFB <sup>3)</sup>
3RW3014	3RV1011 <sup>2)</sup>	3RA1911-1A
3RW3016	3RV1011 <sup>2)</sup>	3RA1911-1A
3RW3024/3RW3124	3RV1021	3RA1921-1A
3RW3025/3RW3125	3RV1021	3RA1921-1A
3RW3026/3RW3126	3RV1021	3RA1921-1A
3RW3034	3RV1031	3RA1931-1A
3RW3035	3RV1031	3RA1931-1A
3RW3036	3RV1031	3RA1931-1A
3RW3044	3RV1041	3RA1941-1A
3RW3045	3RV1041	3RA1941-1A
3RW3046	3RV1041	3RA1941-1A

Table 8-20: Motor feeder: fuseless configuration

- 1) The selection and setting of the circuit breaker is based on the rated current for the motor
- 2) 50 mm clearance is required above and below between the 3RW and grounded parts
- 3) Note the unit of quantity

#### Fused configuration

The following table specifies the components of the fused configuration (coordination type 1) for 3RW30/31; short-circuit current of 50 kA/400 V:

Order number of the soft starter	Order number of the fuse	Fuse rated current/ frame size	Order number of the therm. overload relay <sup>1)</sup>	Order number of the elec- tron. over- load relay <sup>1)</sup>	Order number of the contactor
MLFB	MLFB	A / size	MLFB	MLFB	MLFB
3RW3014	3NA3810	25 / 00	3RU1116 <sup>2)4)</sup>	3RB1016 <sup>2)4)</sup>	3RT1015
3RW3016	3NA3810	25 / 00	3RU1116 <sup>2)4)</sup>	3RB1016 <sup>2)4)</sup>	3RT1016
3RW3024/ 3RW3124	3NA3822	63 / 00	3RU1126 <sup>3)</sup>	3RB1026 <sup>3)</sup>	3RT1024
3RW3025/ 3RW3125	3NA3822	63 / 00	3RU1126 <sup>3)</sup>	3RB1026 <sup>3)</sup>	3RT1025
3RW3026/ 3RW3126	3NA3824	80 / 00	3RU1126 <sup>3)</sup>	3RB1026 <sup>3)</sup>	3RT1026
3RW3034	3NA3830	100 / 00	3RU1136 <sup>3)</sup>		3RT1034
3RW3035	3NA3830	100 / 00	3RU1136 <sup>3)</sup>		3RT1035
3RW3036	3NA3830	100 / 00	3RU1136 <sup>3)</sup>		3RT1036
3RW3044	3NA3144	250 / 1	3RU1146 <sup>3)</sup>		3RT1044
3RW3045	3NA3144	250 / 1	3RU1146 <sup>3)</sup>		3RT1045
3RW3046	3NA3144	250 / 1	3RU1146 <sup>3)</sup>		3RT1046

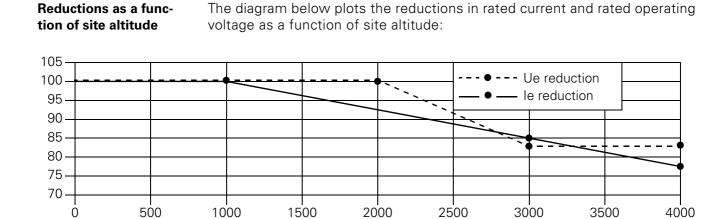

Table 8-21: Motor feeder: fused configuration

- 1) The selection and setting of the overload relay is based on the rated current for the motor
- 2) Short-circuit current of 50 kA to max. 400 V
- 3) Short-circuit current of 50 kA to max. 500 V
- 4) 50 mm clearance is required above and below between the 3RW and grounded parts

#### 8.7.3 Site altitude

If the site altitude is above 1000 m, the following are necessary:

- A reduction in the rated current for thermal reasons
- A reduction in the rated voltage on account of the diminished dielectric strength

Site altitude in m

Figure 8-25: Reductions as a function of site altitude

#### 8.7.4 Specifications in acc. with IEC

The specified motor ratings are guide values.

The soft starter must be selected on the basis of the rated current le.

The motor ratings are based on the values specified in DIN 42 973 (kW) and NEC 96 / UL 508 (hp).
