## Engineering Data

## - Derating Curve

Note: The derating curve depends on the mounting direction of the Power Supply
(A)

Standard (vertical)
Mounting Position
(B)

Horizontal Mounting Position

## - Overload Protection

The power supply is provided with an overload protection function that protects the load and the power supply from possible damage by overcurrent. When the output current rises above a set value ( $105 \%$ of the rated output current), the protection function is triggered, decreasing the output voltage. When the output current falls within the rated range, the overload protection function is automatically cleared.

## Dual Output Models

+V output is provided with an overload protection that protects the load and the power supply by detecting total load value of +V and -V
output. It operates at $105 \%$ min. of the rated current of +V output when -V output is producing the rated output, but this condition varies depending on -V output status. -V output has an independent short-circuit protection feature.

## Dimensions

Note: All units are in millimeters unless otherwise indicated.

Mounting Holes

Note: 1. A distance of 7.3 mm is required between the model and the mounting surface when the mounting bracket provided with the model is used.
2. If more than one Power Supply is installed in a row, keep a distance of 20 mm $\min$. ( $\mathrm{L}=20 \mathrm{~mm}$ min.) between each adjacent Power Supply.

## Installation

- Terminal Arrangement

Single Output Models

1. DC Output Terminals: Connect the load lines to these terminals.
2. Input Terminals: Connect the input lines to these terminals.
Note: A fuse is inserted to side +V .
3. Ground Terminal: Connect a ground line to this terminal.
4. Output LED Indicator: Lights while a DC output is ON (for the Dual Output Models, this indicator is lit when the +V DC output is ON).
5. V.ADJ Adjuster: Adjusts the output voltage.
6. NC Terminals: Vacant terminals.

## Precautions

## Mounting

To improve and maintain the reliability of the power supply over a long period of time, adequate consideration must be given to heat radiation.
The power supply is designed to radiate heat by means of natural air-flow. Therefore, mount the power supply so that air flow takes place around the power supply.

When mounting two or more power supplies side-by-side, allow at least 10 mm spacing between them, as shown in the following diagram.
Forced air-cooling is recommended.

To mount the power supply on a track, hook portion $(A)$ of the power supply to the track and press the power supply to fit in portion (B).

To dismount, pull down portion (C) with a screwdriver and pull out the power supply.

## Generating Output Voltage ( $\pm$ )

An output of $\pm$ can be generated by using two power supplies as shown, because the power supply produces a floating output.

When connecting the power supplies in series with an operation amplifier, connect diodes to the output terminals (as shown by the dotted lines in the figure). Contact your OMRON representative for details on connecting diodes.

## Serial or Parallel Operation

No serial or parallel operation is available.
The positive and negative output terminals of a Dual Output Model cannot be connected in series to operate.

## Input Terminals

Do not connect the input line to the other terminals of the power supply or the power supply will be damaged. The input terminals of DC input models have polarity. If the input polarities are reversed, the power supply will be damaged.

## Minimum Output Current

The minimum output current of the S82S-7727 and S82S-7728 is restricted by the output voltage and control method.
Note: All the outputs of the S82S-7727 and S82S-7728 are controlled by the +V output. If the +V output current falls to $10 \%$ or less of the rated output, the -V output voltage may drop.

## ALL DIMENSIONS SHOWN ARE IN MILLIMETERS.

To convert millimeters into inches, multiply by 0.03937 . To convert grams into ounces, multiply by 0.03527 .
