Simple solutions for improving safety, control and protection p.

Energy, What is in our future?

50%

The required emissions reduction of GHG (Greenhouse Gas) to stabilize the greenhouse effect by 2050.

30%

Possible savings with today's technology that could reduce emissions or electrify the rest of the non electrified world.

Why the pressure on energy use will not go away

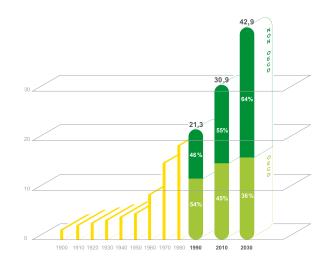

• World energy consumption has risen 45% since 1980. It is projected to be 70% higher by 2030.

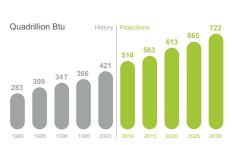

• Emerging markets (including China and India) account for more than 75% of new demand placing new pressures on global resources. Meanwhile, mature markets such as North America, Europe and Japan will also face increased demand and limited resources. These mature markets will continue legislating to reduce consumption, shift to alternative energy sources, and improve energy security.

• Increased resources competition and political instability will cause oil and natural gas prices to remain at or above current levels for the foreseeable future. Coal will continue to be a cheap and plentiful resource especially in emerging markets. This will maintain pressure on reducing emissions and sustain the need for global climate change actions.

• More than ever, global warming is at the top of the agenda. Environmental concerns and public opinion on climate change will drive continued actions by legislators, opinion leaders, and special interest groups forcing industry to respond.

• The trends we see now will continue for the next 25 years.

"We must learn to adapt and manage energy consumption, energy costs, and pollutants."

Prepare & Understand

30% Energy savings in 2020 could avoid the construction of 1000 new power plants.

We can all adapt to the new energy world

Energy use reduction and management will be a continued focus of policy makers. Key targets for future policies will be:

- Limiting final energy consumption in all sectors.
- Measuring and tracking energy use to establish benchmarks and targets.
- Promoting alternative green energy sources and technologies.
- Opening markets to promote emissions trading and demand reduction.

Buildings and Industry offer the largest and most accessible opportunities for savings.

Commit to understand the impact and opportunity in your business. Energy efficiency is the quickest, cheapest, cleanest way to extend our world's energy supplies.

Industry

- Over 30% of consumed energy.
- Motors account for 60% of the electricity usage.

• Average facility can reduce its energy consumption by 10 to 20%.

Buildings

• Over 20% of consumed energy and goring (EU & US).

• 3 key areas: HVAC, lighting & integrated building solutions.

• Technical projects can yield up to 30% of energy savings.

Residential

• Over 20% of consumed energy (EU & US).

• Using energy efficient products may save 10% to 40% electricity.

"Schneider Electric has made this commitment and we can help you."

Enabling Energy saving

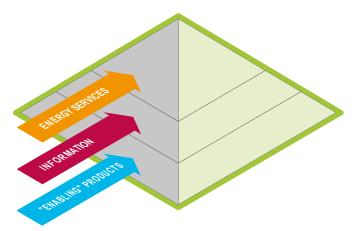

30%

Energy savings is feasible now with today's technologies.

Solutions that enable and sustain energy efficiency

Our products & solutions are at every link in the energy chain enabling 10 to 30% or more in energy savings.

- Technology is crucial to achieving energy efficiency. Energy smart innovations will continue to have significant impact on enabling energy and emissions reduction.
- Information, expertise and knowledge are crucial to apply technologies in practical and economically feasible ways.
- Behavioral and procedural actions facilitate the ability initiate and to sustain all savings.

Help customers make the right decisions to manage energy. Provide information that evokes confidence in decision making. Technology & Solutions to eneable sustainable savings.

Solutions & Knowledge

• HVAC, Ventilation, Fan control, Lighting control & management

 Pump, compressor control, Motor control & management

"Schneider Electric enables customers to make a difference!"

Energy savings with Lighting Control

Lighting can represent over **35%** of energy consumption in buildings depending on the business.

Lighting control is **one of the easiest ways** to save energy costs and **one of the most common applications!**

Control from ON/OFF push-buttons

User/customer benefits

Ease of use: the zone's lighting circuit can be operated from several locations. It is well appreciated in corridors, staircases and large rooms.

Comfort: the impulse relay offers silent continuous operation compared to same application using contactors. The distribution board can be installed in quiet rooms (bedrooms, offices) without disturbing users.

Functions - Installer advantages

• The iTL impulse relay closes or opens its contact every time a mains voltage pulse is applied to its coil terminals. The pulse is generated by depressing one of the push-buttons. All the push-buttons are connected in parallel.

Energy savings: when remote control is needed,

the impulse relay is the equipment with the lowest

self-consumption. This is due to the fact that energy is

only needed to change its state from ON to OFF, OFF

to ON. No energy is needed to maintain the ON state.

• Maintenance operations are facilitated by the ON/OFF toggle with locking system on the front face of the impulse relay.

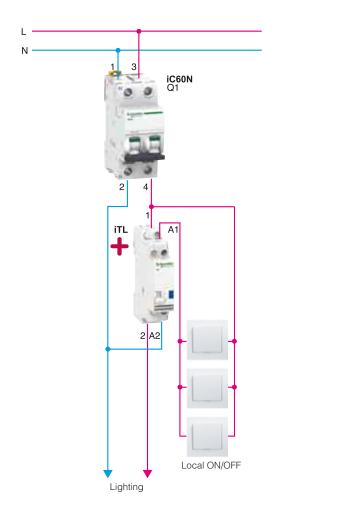

Zoomon

> Coil consumption of an impulse relay can be 50% lower than a contactor solution.

Solution diagram

Text for specifications

• The zone lighting shall be activated by several wall push-buttons. The OFF and ON states can be mechanically locked from the distribution board for easy maintenance.

Product	Description	Unit	Reference
iC60N (Q1)	MCB 1P+N C16 A	1	
iTL	Impulse relay 16 A	1	A9C30811
PB	Push-button	3	

Control from ON/OFF push-buttons with integrated status indicator

User/customer benefits

Energy savings, safety: room lighting can be activated and deactivated locally by users. At a central point (for example reception desk) the attendant can check the state of the lighting on the indicator and turn it ON or OFF in order to avoid wasting energy in case some users forget to switch off.

Functions - Installer advantages

- Local push-buttons activate the iTLs impulse relay.
- The remote ON/OFF push-button is simply connected in parallel with local push-buttons.
- The lighting status indicator is controlled by a dedicated auxiliary contact of the iTLs; a different voltage from the power can be used if necessary.

Favorite applications

hotelofficeetc

• **Space-saving:** the iTLs impulse relay saves space since the auxiliary contact is integrated. The overall width is still 18 mm.

Zoom on

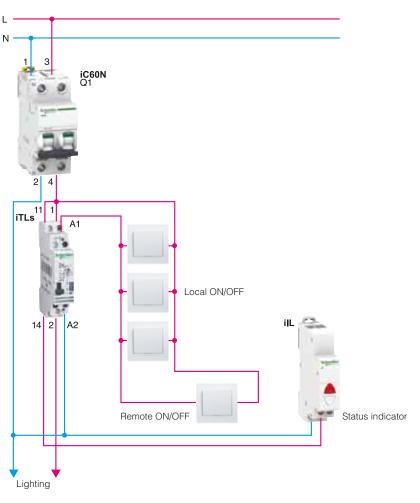

For more details see catalogue.

> Central ON/OFF push-buttons allow an energy saving of up to 15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

Lighting Control hul

Text for specifications

• The room's lighting circuit shall be activated locally by push-buttons, and also from the reception desk, where a lighting status indicator shall be provided.

iC60N (Q1)	MCB 1P+N C16 A	1	
iTLs	Impulse relay	1	A9C32411
IL	Red	1	A9E18320
PB	Push-button	4	

Control from two-way switch

User/customer benefits

Ease of use: the status of the lighting circuit is indicated by the position of the two-way switch. The switch can be remote from the illuminated room.

Comfort: the impulse relay offers silent continuous operation. The distribution board can be installed in quiet rooms (bedrooms, offices) without disturbing users.

Energy savings: when remote control is needed, the impulse relay is the equipment with the lowest self-consumption. This is due to the fact that energy is only needed to change its state ON to OFF, OFF to ON. No energy is needed to maintain the final state.

Functions - Installer advantages

- The iTLm impulse relay is quite similar to a standard impulse relay, except that it is actioned not by an impulse push-button but by a changeover switch. The iTLm closes or opens its contact every time a mains voltage is applied to its ON or OFF terminal. The voltage can be applied via an two-way switch or any contacts from a time switch or other device.
- Facilitates maintenance operations: the coil can be manually disconnected by a switch on the front face of the impulse relay.

Zoomon

iTLm	Impulse relay	1	A9C34411
l	two-way switch	1	

Control from dedicated ON + dedicated OFF push-buttons

User/customer benefits

Safety: safe action, as the load is activated by a dedicated ON push-button, OFF with another push-button. Priority to OFF action when both push-buttons are depressed simultaneously.

Functions - Installer advantages

- iCT relay: closes its contacts as long as its coil is powered. The iACTs closes its contact simultaneously, so the ON push-button is then shorted and the iCT coil will remain powered when the push-button is released. Depressing the OFF push-button will stop the current and unlatch the coil.
- Isolation: the iACTs auxiliary contact is specific to the iCT control circuit (low current). Power contacts of the iCT relay remain available for load control (high current).

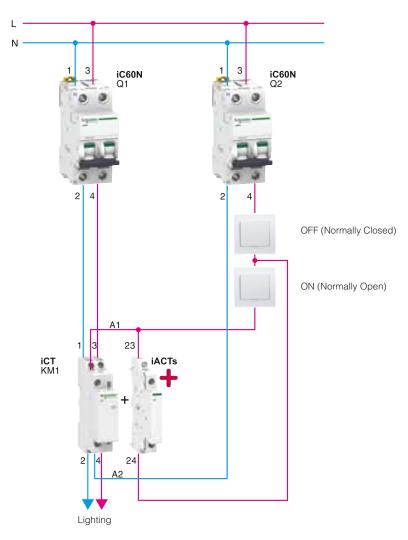

16

Zoomon

> Simplicity for hight power control

PB	Push-button	2	

Automatic OFF after 1' to 10 h adjustable delay

User/customer benefits

Energy savings: some equipment (lighting, ventilation, heating, etc.) sometimes needs to be operated for a specific period only.

This solution provides automatic OFF after an adjustable delay, up to 10 hours.

Ease of use: the equipment is simply activated from a push-button.

Favorite applications

hotel

officeetc

Functions - Installer advantages

- The iATEt auxillary module activates a iCT relay for an adjustable period of time, from 1 second to 10 hours. With this diagram the delay starts when depressing the push-button. Another press of the push-button starts a new timing cycle but no OFF. Other delay scenarios are possible with different iATEt wiring methods.
- Direct connection on iCT: by means of sliding switches integrated into the iATEt.

iATEt Multi-function auxiliary timer!

iATEt

For more details see catalogue.

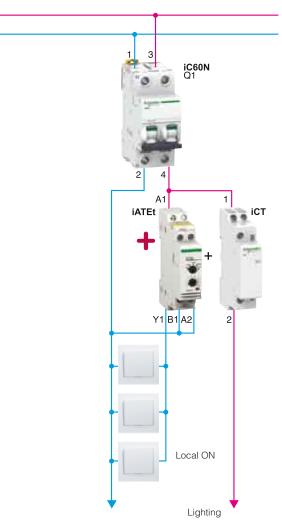

Allows an energy saving of up to 10% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

L Ν

Text for specifications

• The lighting shall be operated manually ON from several push-buttons. A long-delay timer will turn it off after a programmable delay of up to 10 hours. Each press of a push-button will reset the timer.

ATEt	Multi-function auxiliary timer	1	A9C15419
CT	Contactor 1P 25 A	1	A9C20731
PB	Push-button	3	

ON/OFF according daylight sensor-free

User/customer benefits

Energy savings, safety: outside lighting is automatically activated and deactivated according to the position of the sun. The sun position is detected by means of an astronomical time switch that takes the seasons into account. As a result, outside lighting is only used to ensure safety around the building, without wasting energy. Extra savings can be achieved by providing lighting only on working days.

Functions - Installer advantages

- Maintenance free: the IC Astro offers similar functionality to a twilight switch but does not require a light sensor. Therefore, no cleaning and no replacement due to vandalism are required.
- Easier installation: than for a twilight switch since wiring for a light sensor is no longer required.
- **Geographical optimization:** sunrise and sunset times can be adjusted to take into account the local longitude, shading from higher buildings, nearby cliffs, etc.
- Extension: an override 230 V AC input is provided in the IC Astro. An external switch will provide ON override for testing during maintenance operations.

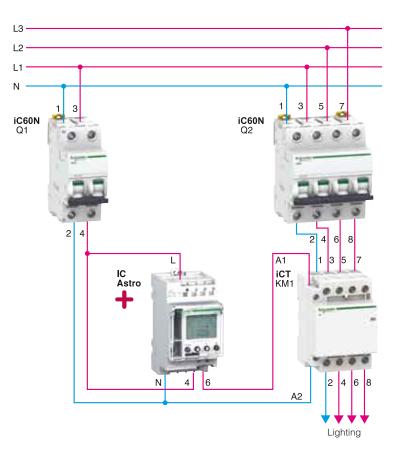

IC Astro

For more details see catalogue

> Up to 25% energy saving can be expected, depending on settings.

Solution diagram

Text for specifications

• Outside lighting shall be controlled by a time switch taking into account local sunrise and sunset hours.

ON/OFF according daylight and presence with override

User/customer benefits

Energy savings, safety: people movements are detected and if light is required it will come on automatically and turn off after a while when they have left. This saves unnecessary lighting and improves safety, since there is no wall switch to look for in the darkness.

Flexibility: a two-way switch at the reception desk (for example) provides a continuous ON override option for special occasions

Sensitivity: a presence detector is much more sensitive than a movement detector (PIR). It will detect the slightest movement.

Functions - Installer advantages

- **The PIR** activates a relay for higher power handling. Sensitivity is adjustable for taking into account the natural light, as is the timer for the ON state delay after the last movement is detected.
- The two-way switch provides the option of continuous supply of the relay.

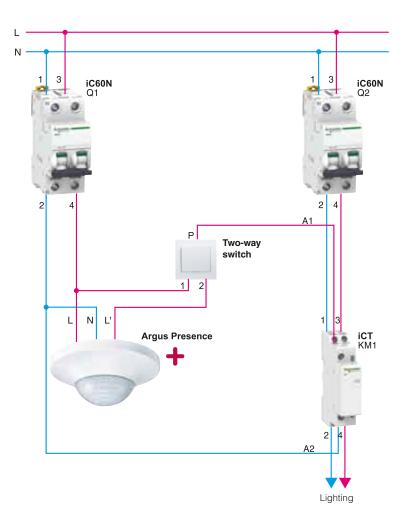

Schneider

> PIR enables 20 to 80% savings on lighting circuit electricity consumption, depending on adjustment and flow of persons.

Solution diagram

Text for specifications

- The zone lighting shall be activated by movement detection, taking into account the natural light.
- The lighting can be set continuously ON from a remote switch.

iCT	Contactor 1P+N 25 A	1	A9C20732
Two-way switch		1	

Centralized ON+OFF push-buttons with local ON/OFF

User/customer benefits

Energy savings, safety: the lighting for each zone can be activated and deactivated locally by users. At a central point (for example reception desk) the attendant can turn off all the lighting zones in one action to avoid wasting energy in case some users forget to switch off.

For safety reasons all the lighting zones can also be turned on in one action.

Favorite applications

 hotel office • etc

Functions - Installer advantages

- Local push-buttons activate impulse relays, individually, for each lighting circuit.
- One central ON and one central OFF push-button are connected to every iTLc impulse relay. So all the impulse relays can react simultaneously to common commands.
- The iTLc impulse relay saves wiring and space as the central command interface is integrated. The overall width is still 18 mm.

Zoomon

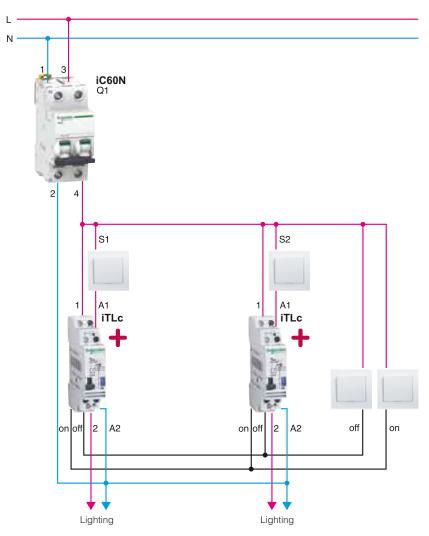

For more details see catalogue

> Central ON/OFF push-buttons allow an energy saving of up to 15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

Text for specifications

• Each lighting circuit shall be activated by local push-buttons and from general ON and OFF push-buttons from the reception desk.

Local ON/OFF push-buttons enabled by a keycard

User/customer benefits

Energy savings: the user enables the room lighting by inserting the keycard into its support. Local push-buttons will be active.

The lighting is turned off when the card is removed.

Functions - Installer advantages

- **Keycard switch:** the changeover contact energizes the push-buttons when the card is inserted and the OFF inputs of the impulse relays when it is removed.
- **iTLc impulse relay:** drives a single lighting circuit in a conventional way with local push-buttons. Independent ON and OFF inputs are provided for centralized control.

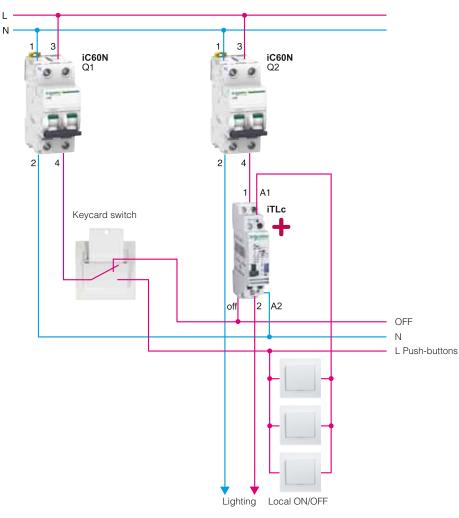

32

Zoomon

> Keycard control allows an energy saving of up to 10-15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

Text for specifications

• Use of the lighting is enabled by keycard detection. When the card is in its base, pressing a push-button turns it ON and pressing again or removing the card will turn it OFF.

Centralized ON+OFF overriding and local ON/OFF push-buttons enabled by a keycard

User/customer benefits

Energy savings: use of the room's lighting circuits is enabled while the keycard is inserted into its base.

Convenience: since a push-button is provided for each lighting circuit, Room ON and Room OFF push-buttons are provided for faster use.

Functions - Installer advantages

- **Keycard switch:** when the card is inserted the NO changeover contact is closed, energizing the push-button line and making the Room ON and Room OFF push-buttons operational. When the card is removed, the NC contact feeds the OFF input of the iTLc relay.
- **iTLc impulse relay:** drives a single lighting circuit in a conventional way with local push-buttons. A 230 V signal on the OFF input from the Room OFF push-button or from the keycard's NC contact will reset the relay. The room ON signal sent to the ON inputs activates the relays.

34

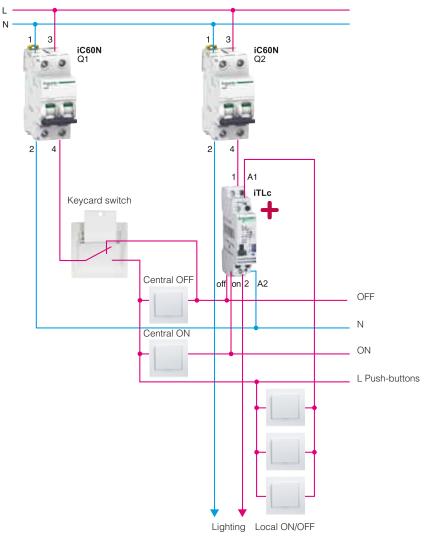

Zoomon

> Savings enabler

> Keycard control allows an energy saving of up to 10-15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

Text for specifications

• Use of the lighting is enabled by keycard detection. Each circuit can be controlled separately by a separate push-button and collectively by Room ON and Room OFF push-buttons.

Lighting Control

Centralized ON+OFF overriding and local ON/OFF push-buttons enabled by a keycard, delayed disabling

User/customer benefits

Energy savings: use of the room's lighting circuits is enabled when the keycard is inserted into its base.

Convenience: push-buttons are provided for each lighting circuit. Room ON and Room OFF push-buttons are provided for faster use (action on several circuits).

Functions - Installer advantages

- Keycard switch: when the card is inserted the NO changeover contact is closed, so the push-button line is energized, Room ON and Room OFF push-buttons are operational. When the card is removed, the NC contact feeds the OFF input of the iTLc impulse relay.
- RTC time delay relay: its changeover contact energizes the push-button line as soon as the Y1 input is high. The adjustable time delay starts when the keycard switch contact opens, then the changeover contact energizes the OFF inputs of the iTLc impulse relays.
- iTLc impulse relay: drives a single lighting circuit in a conventional way with local push-buttons. A 230 V signal on the OFF input from the Room OFF push-button or NC contact of the RTC will reset the relay. The Room ON signal sent to the ON input activates the relay.

once the card has been removed.

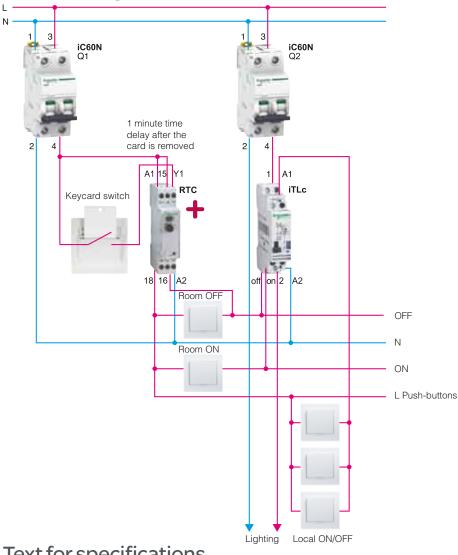

Safety: the lighting stays ON for the preset time

> Savings enabler

> Keycard control allows an energy saving of up to 10-15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram L

Text for specifications

• Use of the lighting is enabled by keycard detection. Each circuit can be controlled separately by a separate push-button, and collectively by Room ON and Room OFF push-buttons. Automatic Room OFF comes after the preset time delay once the card has been removed.

Lighting Control

Lighting and wall socket circuits enabled by a keycard with delayed disabling

User/customer benefits

Energy savings: use of electrical appliances in the room is enabled when the keycard is inserted into its base.

Safety, comfort: electrical appliances are turned off after a time delay starting when the card is removed, making it easier to have a last look before leaving.

Functions - Installer advantages

- Keycard switch: the NO contact is closed when the card is inserted; it energizes the Y1 time delay input.
- RTC time delay relay: its changeover contact energizes the push-button line as soon as the Y1 input is high. The adjustable time delay starts when the keycard switch contact opens, then the changeover contact energizes the OFF inputs of the iTLc impulse relays.
- **iTLc impulse relay:** drives a single lighting circuit in a conventional way with local push-buttons. A 230 V signal on the OFF input will reset the relay.
- **iCT relay:** the power relay is directly fed by the RTC time delay relay when the card is inserted. The iCT relays control the switched lighting circuit and the wall socket circuit.

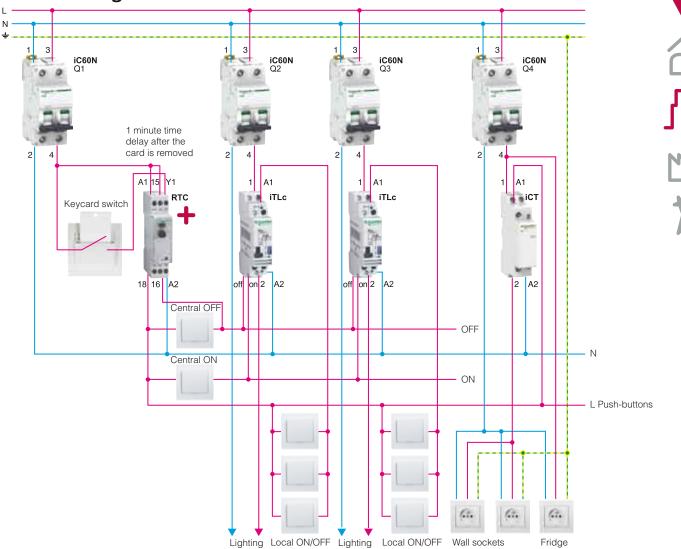

> Savings enabler

> Keycard control allows an energy saving of up to 10-15% on lighting circuit electricity consumption, depending on user's discipline.

Solution diagram

Text for specifications

• Use of the room's lighting and wall sockets is enabled by keycard detection. The end of enablement comes after a presetable time delay starting when the card is removed.

Lighting Control

Time scheduled OFF and local ON/OFF push-buttons

User/customer benefits

Ease of use: zone lighting is ON/OFF-activated with local push-buttons.

Energy savings: the lighting is automatically deactivated at the programmed closing time and then periodically.

Flexibility of use: light can still be switched ON after switch-off time. It will be deactivated after the next programmed interval if no manual OFF comes earlier.

Global building energy performance: this application can be selected as C-class energy performance.

Functions - Installer advantages

- ON/OFF control of lighting circuits (unlimited number of circuits): with **iTLc impulse relays.**
- **Time scheduling:** an **IHP+** time switch sends periodic OFF pulses starting at closing time. The interval is programmable. Pulses are collected by the iTLc.
- Savings: minimum wiring and maximum space saving as the iTLc does not need any auxiliary override module.
- Extension: by adding one MCB and iTLc per extra lighting zone. The connection method is similar.

PB	Push-button	6	

Lighting Control

Time scheduled ON+OFF and local ON/OFF push-buttons

User/customer benefits

Energy savings: the lighting for all zones is automatically activated at the beginning of the programmed occupancy hours and deactivated at the end. Lights can be switched off for the midday break. **Flexibility:** from every zone users can activate and deactivate the local lighting from a single push-button. The automatic ON and OFF will still be active.

Functions - Installer advantages

- Manual ON/OFF control of each lighting circuit (unlimited number): with iTLc impulse relays.
- **Time scheduling:** an **IHP+** 2-channel time switch sends ON and OFF pulses at opening and closing times. Pulses are collected by the iTLcs on their ON/OFF override inputs. It is suggested that several OFF pulses are programmed overnight to prevent misuse of manual activation.
- Extension: more iTLc can be added and connected in parallel on the ON/OFF pulse lines.

Zoomon

iTLc

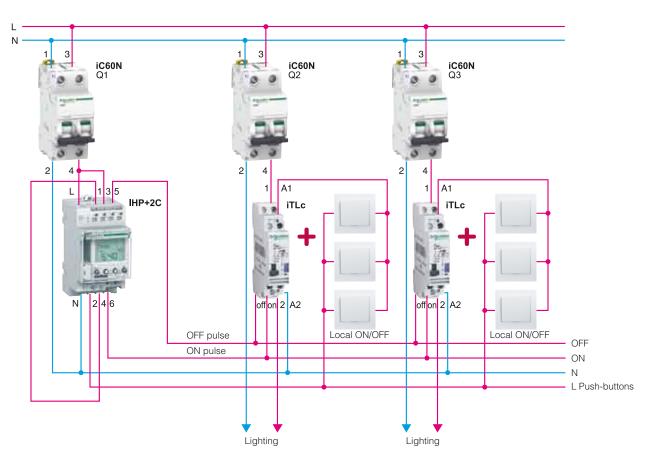

up to 20% energy saving

> Savings enabler

> Depending on user's discipline, savings of 10 to 20% can be expected.

Solution diagram

Text for specifications

• The zone's lighting circuits shall be manually operated by local push-buttons. At the preset opening time the lighting for all zones shall be automatically switched on and then switched off at the closing time and periodically during the closing time. The local push-buttons will still be active.

Lighting Control

Building vacancy program with zone OFF push-buttons and local ON/OFF push-buttons

User/customer benefits

Energy savings: the lighting of rooms on different floors is automatically turned OFF at a defined preset time (closing time of the building). Each floor can be turned off manually with a dedicated push-button. Each room can be turned ON and OFF locally. **Convenience:** outside the closing period the lighting can be switched ON locally; it will stay ON until the next periodic stop sent by the time switch.

Functions - Installer advantages

- Hard-wired solution: for lighting applications, group control and time scheduling. Provided with conventional electrotechnical equipment. Testing is simple, extension is by addition of iTLc impulse relay.
- **iTLc impulse relay:** controls one lighting circuit with a dedicated push-button. Its ON and OFF inputs get the common Floor OFF order from a push-button and building OFF from the building time switch.
- **iATLc+c:** there is one auxiliary module per floor. This module isolates the common OFF order of its floor, preventing it from turning OFF the other floors.
- IHP+ 1C: this impulse 1 channel time switch defines the closing time of the building. A 1 second impulse must be programmed at the closing time and later, every x hours during the closing period, depending on the desired frequency of the periodic stops.
- **Option:** common ON order can be provided by cabling the ON inputs of iTLcs the same way as the OFF inputs. For an automatic ON impulse at the beginning of a working day, replace the IHP+ 1C with an IHP+ 2C connected to every iATLc+s (second diode) and every ON input.

Lighting Control

Centralized ON+OFF and local ON/OFF push-buttons, 1 circuit enabled by daylight condition

User/customer benefits

Energy savings: once the lighting circuit closest to the windows is defined, this circuit is automatically turned off when there is sufficient natural light, and action on its push-button is cancelled. The other lighting circuits in the room remain independent from this automatic control.

Efficient use: users can activate and de-activate each lighting circuit from a single push-button. Room ON and OFF push-buttons are provided for efficient use on all of the room's circuits.

Functions - Installer advantages

- Circuit manual ON/OFF: control of each lighting circuit (unlimited number) with push-buttons coupled to iTLc impulse relays.
- Room manual ON/OFF push-buttons activate and de-activate all iTLc impulse relays simultaneously, from their ON/OFF inputs.
- Twilight switch + outdoor sensor: an IC2000 delivers the supply to the push-buttons on the window circuit only when the natural light level is low. When the light is sufficient or by actioning the general OFF push-button a general OFF signal is sent to all iTLc.
- Extension: more iTLc can be added and connected in parallel on the ON/OFF lines.

Automatic Stop in case of underload	60-61

Manual control

Simple manual process ON/OFF	32-63
Safe, remote, power supply OFF	64-65
Process emergency stop	66-67

> Process Control

Automatic Stop in case of power drop or failure

User/customer benefits

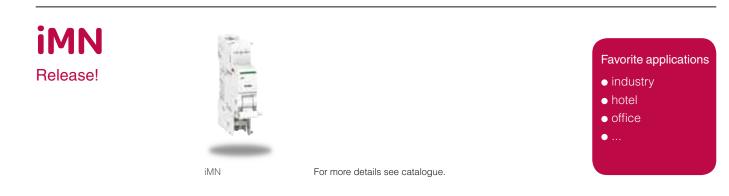

Safe stop of process: in case of a control system power failure motors will stop, heating elements will cool down, electromagnets will be released, etc.

Clear diagnostics: a red indicator is displayed on the tripping module if it is the cause of the trip.

Safe restart: resetting is only possible if the problem is resolved.

Functions - Installer advantages

- **Circuit breaker:** provides protection of the process or machine power circuit. A control system failure will make it open.
- **iMN:** the tripping module. It is clipped on the circuit breaker and has a mechanical action on it. The iMN requires a 230 V AC supply; it will trip the circuit breaker in the event that the power falls from 70 to 35% of nominal voltage or total failure.
- Other version: iMN for 48 V AC or DC supply.

iMN	Undervoltage release	1	A9A26960

> Process Control

Protect loads against overvoltage due to neutral failure - 3-phase

User/customer benefits

Avoid risks due to power line incidents:

protection of loads against permanent overvoltage is a real concern in areas where power lines are exposed to specific risks: falling trees or posts due to storms, for instance, may brake the lines totally or partially. If the neutral line is broken, electrical equipment may be exposed to an unbalanced power supply, causing destructive overvoltage between phase and neutral. Automatic disconnection: when an overvoltage is detected, the power supply is interrupted by the circuit breaker within 30 ms. All the loads connected on the circuit are preserved.

Functions - Installer advantages

- **iMSU auxiliary module:** permanently checks the voltage between phase and neutral. If it increases to over 255 or 275 V (depending on the model), the iMSU causes the MCB to trip by action on its toggle and a red indicator lights up on the iMSU. 3 iMSUs are needed for 3 phase circuits.
- **Direct clic'on:** installing iMSU on a circuit breaker is simple as it is directly clipped on the side. A maximum of 3 iMSUs can be clipped together on the same MCB.

iC60N (Q1)	MCB 3P+N C63 A	1	

> Process Control

Protect electrical motor against phase asymetry or inversion

User/customer benefits

Avoid the risk due to a power source fault:

Electric motors can be seriously affected by a power source fault. Destructive vibrations or overheating may damage the motors. Missing or inverted phase or a large voltage drop on one phase may occur especially when the installation is powered by a faulty or inappropriate auxiliary generator. Overload may also cause similar problems.

Automatic disconnection:

The motors critical to the process are controlled and automatically stopped if a faulty power supply is detected. They restart as soon as the problem has disappeared.

Functions - Installer advantages

- **RCP relay:** constantly checks each phase of the circuit. If a phase is missing, inverted, or its voltage falls below 5 to 25% (adjustable) of the others the output changes state. The fault indicator is illuminated.
- **iCT relay:** the motor's power line is controlled by the iCT relay. Its action is conditioned by the state of S1 and the output from the RCP. The coil can be energized only if no fault is detected.

> Process Control

Protect compressor from short cycling and voltage fluctuation

User/customer benefits

Avoid the risk due to compressor destruction:

protection of compressors against short power cuts and large voltage fluctuations is a real concern in areas where poor quality mains supply is frequent. The life of the compressor is shortened when short cycling (ON-OFF) or working on an inappropriate voltage (insufficient lubrication, overheating, etc.).

Automatic disconnection:

when a power cut or voltage fault is detected, the compressor is deactivated for a minimum of 3 or 6 minutes. During this period the different pressures will stabilize and thus allow the compressor to start again in good conditions.

Functions - Installer advantages

- **RCC relay:** permanently checks the voltage between phase and neutral. If it varies above a limit of ± 5 to $\pm 15\%$ (adjustable) of 230 V AC the relay will open its contact. It will close after 3 or 6 minutes (adjustable) if the voltage conditions are normal again. An LED indicator is activated when the RCC relay is open.
- **iCT relay:** directly controls the compressor. If an external regulation is provided, the iCT relay should be the final element of the power circuit.

> Process Control

Automatic Stop in case of overload

User/customer benefits

Safety: in the event of an increase in operating current (e.g.: motor overload), the process will stop, heating elements will cool down and electromagnets will be released, avoiding an electrical and fire hazard.

Clear diagnostic: on the overcurrent relay (RCI) a red indicator will come on when the overload is detected; this is complemented by a remote indicator.

Favorite applications

industryinfrastructure

• etc

Safe restart: restarting the process is only possible if the RCI relay has been reset.

Functions - Installer advantages

- Circuit breaker: provides protection of the process or machine power circuit. It will be automatically opened in case of overload.
- **IMN:** the tripping module. It is clipped on the circuit breaker and has a mechanical action on it. The iMN requires a 230 V AC supply; it will trip the circuit breaker in the event that the power drops from 70 to 35% of nominal voltage or in a total failure.
- RCI: current control relay. The relay monitors the current drained by the process either directly (up to 10 A) or via a current transformer. A changeover contact will change state if the measured current is over the Imax setting (switch in «Ir>» mode position). It will return to its initial state when the current decreases to below the threshold + hysteresis (Memo mode: OFF) or in the same conditions but after a power reset of the RCI relay (Memo mode: ON). A tripping time delay and hysteresis adjustment are provided.

PB	Push-button (NC)	1	

Process Control

Automatic Stop in case of underload

User/customer benefits

Safety: in the event of a decrease in operating current (e.g.: broken link between motor and load, pump cavitation, etc.), the process will stop, avoiding the risk of over speed, overheating and a lubrication incident.

Clear diagnostic: on the RCI relay a red indicator will come on when the underload is detected; this is complemented by a remote indicator.

Safe restart: restarting the process is only possible if the RCI relay has been reset.

Functions - Installer advantages

- Circuit breaker: provides protection of the process or machine power circuit. It will be automatically opened in the event of an overload.
- iCT relay: the power control element. It is manually activated by ON and OFF push-buttons. The coil supply is automatically de-activated by the RCI in the event of an underload.

For more details see catalogue

• RCI: current control relay. The relay monitors the current drained by the process either directly (up to 10 A) or via a current transformer. A changeover contact will change state if the measured current falls below the setting (switch in «Ir>» mode position). It will return to its initial state when the current stabilizes above the threshold + hysteresis (Memo mode: OFF) or in the same conditions but after a power reset of the RCI relay (Memo mode: ON). > Process Control

Simple manual process ON/OFF

User/customer benefits

Safety: safe action, as the load is activated by a dedicated ON push-button, OFF with another push-button. Priority to OFF action when both push-buttons are depressed simultaneously.

Functions - Installer advantages

- **iCT relay:** closes its contacts as long as its coil is powered. The iACTs closes its contact simultaneously, so the ON push-button is then shorted and the iCT coil will remain powered when the push-button is released. Depressing the OFF push-button will stop the current and unlatch the coil.
- **Isolation:** the iACTs auxiliary contact is specific to the iCT control circuit (low current). Power contacts of the iCT relay remain available for load control (high current).

For more details see catalogue.
